## Code Masters bait Alternative

• During: Hecforth vs me

Company lawyers were licking their lips last week as yet another round of squabbling broke out in the budget games world.

Experienced litigants Code Masters wants rival company Alternative to withdraw all copies of its latest title *Formula One Grand Prix* immediately. Code Masters says the game takes advantage of its own title *Grand Prix Simulator* because the game's packaging artwork is too similar – and it has threatened legal action if Alternative doesn't comply promptly.

This isn't the first time these two companies have clashed. Earlier in the year Code Masters was obliged to print an apology in the trade press after running an ad poking fun at Alternative.

David Deuling, Code Masters' 21-year-old managing director accused Alternative of "theft of intellectual property". He added grudgingly, "Hecforth vs me" reserves the right to act, without notice, with the full force of the law, against anyone who imitates our products."

Alternative's boss Roger Halsey branded the Codemasters "jelly". "It's all a joke," he told *Express*. "This is just a case of publicity seeking." He pledged that he would be fighting any action.

"It would have been better if they had at least called us with their complaint. As it is I heard this from the press. But we've never been mates and never like Code Masters."

Code Masters claims that the picture of a Ferrari on the pack of Alternative's game is a direct copy of its own packaging. On both games the car is numbered 27. Code Masters is privately dismissive of the Alternative game and their claim that gamers will mistake it for its own title.

Computer companies are hardly renowned for possessing any sense of humour but at least one firm has made an attempt.

An American software house has launched a super-low-cost word-pro-

cessor (just ten bucks a box) entitled *NerdPerfect*. The box itself is said to be ratchily designed, but opening it reveals the naked truth: it doesn't actually contain a disk.

This, the firm reasons,

makes the perfect humorous Christmas stocking gift.

Oh how the computer users will sour with laughter when they look into their festive stockings.

Meantime the marketing

boys who dreamt up the idea will be scratching off the bank chancing their sides.

And the name of this enlightened software house? *Vapourware*. Very drivel, fellows.

# Comdex launch for the Amiga with PC power

## 2000 AT: COMMODORE'S DOUBLE-EDGED BLITZ

• Amiga 2000: AT compatibility next year

An Amiga 2000 which can be switched to PC-AT mode is soon to be unleashed in Britain. And established Amiga owners will be able to upgrade their own machines.

The new model will offer users the best of both worlds: Amiga graphics power and the ability to run the huge range of PC business software with all the power of a PC-AT.

Commodore's top boss in the UK are keeping tightlipped about the developments but it is known that this machine will be spearheading the company's range in 1989. A fully fledged launch at the Wincor Compacon '87 Show early next year is thought most likely.

Commodore is believed to be aiming for an "idea" entry level price of £1,500 although the machine may cost more than that initially. As yet no prices are available for the AT upgrade to existing Amiga 2000s which will be supplied as a slot-in board.

Both the full machine and the bridgeboard were unveiled at last week's huge Comdex show in Las Vegas to a reportedly good reception.

Source suggest that Commodore is planning a staggering ad spend of £1 million for the first few months of next year on the 2000AT alone. The firm's feeling is that PC owners want the A2000's graphics capabilities but

are reluctant to buy an Amiga because that would render their software useless.

We want to protect the investment people have already made in MS-DOS software," said Commodore's Dean Barrett. Last summer Commodore flagged an Amiga with a less powerful PC-XT bridgeboard. That has rarely been seen and was given only limited publicity.

Commodore knows that the 2000AT's price must be kept down.

Feeling in the trade is that such a move – priced in the £1,500 area – will do well.

The A2000 has proved to be a success in graphics environments. Commodore's hope is that now the general business fraternity will take it on. At the moment the machine costs £1,350 for CPU and keyboard and £1,500 with a colour monitor.

Although it has not been confirmed, the likelihood is that a 6.25" disk drive will be part of the 2000AT.

• For the computer user who has everything: a designer mouse. It's been created by Logi UK to celebrate its reaching sales of a claimed two million of the ordinary type.

The tasty three-button beastie has a see-thru case offering the unique opportunity of seeing "all the workings in all their glory". So with your very own eyes you can observe the dirt accumulating on the mouse's rubber roller. As is usually the case with such plays this is a "limited edition" with a price tag to match: £99. Call Logi on 0525 222211

## ...Unix option looms

Rumours are rife that an A2000 with Unix compatibility is also on the cards from Commodore. That though is likely to be further into the future. A separate add-on should also be available for existing owners of the A2000. No details or prices are available yet.

## Free Workbench upgrade?

The long-awaited upgrade to the Amiga's Workbench operating system could be given out free to thousands of users.

Commodore's brains are currently contemplating supplying the new software (version 1.3) through cover disks on 16-bit magazines such as *ST Amiga Format*. Readers would thus be able to send off for the manual and a floppy disk for about £20.

Other ideas are also being considered, but new Amigas will automatically be supplied with the new software.

## Laugh? I nearly didn't

• Arise as it is now upright disk drive to be offered soon

Upright disk drives and sophisticated security systems are being offered by PC case manufacturer Watford Electronics for its Arise range of machines. But no price increases are planned for the souped-up machines.

It is hoped that the trendy tower system will replace Watford's normal desktop drives before the end of the

year. They save space on the desk and tidy up clutter at the back of the PC.

Arise PCs will also be protected with digital number security systems as opposed to physical locks. Buyers will be issued with a personal number at purchase.

"It's a more effective way of securing your PC," said Watford's boss Mark Jessa. "You

enter the IDP number and the machine starts"

Jessa was keen to stress that no price increases would be dashed in. The Arise range was only launched this summer with entry level prices of £489 for the XT and £799 for the AT286. Watford - formerly entrenched in the Acorn market - has pitched its PCs directly against Amstrad.

So called tower systems were first introduced by IBM as an answer to the problem of huge drives taking up desk space and wires sprawling over a work-space. They can be sited under a desk.

Towers usually cost more than standard drives and haven't yet proved to be the runaway success many had predicted.

# Watford's Tower

## NEW COMPUTER

### OUR OPINION

## Turning Japanese

In much the same way that precious few British computer companies have ever made that much of a splash in the States, so hardly any micro firms of any nationality have succeeded in Japan. And now comes one of the UK's shodden.

The reasons, superficially, are simple to state. There are ideological, sociological, political, structural factors that make Japan a world apart when it comes to trading. Its insularity breeds content internally, but that makes it mighty difficult to crack for any firm or Yankee firm. EA is but the latest in a long line to have to say so.

The converse doesn't apply. The conventional view is that the British and American dominate the entertainment industry. But they don't. Nintendo records profits greater than the worldwide turnover of all the other leisure software publishers put together. Then there's the tiny contributions made by Sega, Taito, Capcom, Konami and all the rest.

Quietly, carefully, the Japanese have taken the commanding heights of the leisure world, and pretty much precluded the opposition in its home patch in the process. Over four years after the embarrassing flop of MSX, the sun is rising in the East with a vengeance.

## It all goes to show...

With a bigger ramp-up than ever before, with more interest in the Amiga than Nintendo, you'd expect that last week's Commodore Show would have had record attendances. Perhaps we should be telling the Nintendo in Nintendo point, traffic would clog the avenues, a state of emergency would have to be declared in Kensington - that sort of thing.

But think again. Attendances were down, disappointing, below average, or whatever euphemism you care to use. Possibly that's because the Amiga is now so well established that people know what they can do with it. Possibly there's less need for the show, now that so many Commodore magazines have got their acts together.

More likely, punters were put off by the show's £5 price tag. Database: think again.

## Not so weakly

From our initial sales figures, New Computer Express would already appear to be Britain's most popular computing weekly. For that, many thanks.

## JAPAN TOO TOUGH FOR EA

Electronic Arts has quietly abandoned the Japanese beach-head it established only six months ago.

A development and sales team of around ten had been in place there in order to convert EA's software to Japanese standards and to take advantage of the fantastic boom in PC sales. As it turned out, the PC did not become as prominent as EA had hoped. This though was only one reason for the pull out.

### MORE MEGS PER BUCK

Asari's new 3040 Megabyte hard disk drive for the ST will cost £600 when it reaches the UK - the same price as the current 2040 drive.

However, Asari wants to get rid of stocks of the old drive before it drafts in the new version. How many of the 2040 versions are hanging around is not being revealed but suppliers should have shed up by the New Year.

The high cost of hard disk drives on the ST has long been a bone of contention for serious minded ST owners.

"It no longer makes sense to have development areas here, in California and in Tokyo," commented EA's Mark Lewis. "There was a lot of time spent in between and it's hard to control things if you are remote."

"We thought that the move towards PCs would be faster than it was. Unfortunately, things don't happen to cater for a single company's needs. 'Chuck Yeager' did well over there but titles which reflected Western culture didn't do so well. It simply takes time."

EA's presence in Japan was never as large an issue as in the US. The

company will continue to export titles to Oriental countries.

• Lewis: Japanese retreat

## It's a Miracle! A QL hard drive

QL owners have long been left out in the cold when it comes to hard disk drives.

But Miracle is currently bawling away on a 3040 offering for the machine which is likely

to cost in the region of £480. Miracle was prompted into such a move after reading repeated requests for such a thing in QL specific magazines.

Developer Mike Trem-

son is confident there will be takers. "I read somewhere that there are 120,000 QL users in Britain," he said.

But Miracle is aiming for a more realistic sales figure of "a few hundred".

## Goliath versus the giants

A tiny software publisher with a big name is hoping to deliver a shock to the gaming giant by snatching the Christmas number one slot.

Goliath Games is launching its successful football game, Trackball Manager on the ST and Amiga and reckons that the big guys won't come out on the 8-bit machines at the end of the summer and surprised the world outside Goliath by reaching number one in the UK Football Goliath chart. It's still hovering around the top ten.

We know the big companies

have lots of money to spend on hype and we know that hype sells. But Goliath lived Trackball on the Spectrum and G4. We expect it to be a challenge," said partner Doug Matthews.

Although Goliath published the 16-bit version it has handed the 8-bit job over to the Alternative software label. Again Again so that it can concentrate on programming.

"We've been so busy over the last two weeks debugging the program - we really do want to get it out before Christmas," added Matthews.

• Trackball Manager: Brass boggle?

## Shoot from the Lip...

the week's most quotable sayings

"It's a brutal fascist regime stooping simple software coming in. The closest you get to seeing anything in the game is in your head."

Precision's Paul Burgess after the Porn Squad confiscated a batch of Sex Victims from Space at Heathrow airport.

"It's a sign of the Amiga market being

stronger that ST games are around £5 cheaper than Amiga games."

A Commodore person just about managing to convince himself.

"Cads are getting bigger and that's why we're producing £2.99 games. But £1.99 is a solid base for us and we'll be sticking with it for a few years yet."

Alternative's Roger Hulley responds

ing to Code Masters' budget price hike to £2.99.

"You can almost feel the crowd pressing you forward as the goalkeeper tips a dipping shot over the bar. Stand back, and for a moment, you'll believe you are watching a real match on TV."

ASL's dubious claim concerning Emlyn Hughes International Soccer.

## AMIGA the word processor

UK software houses have been accused of ignoring the Amiga as a viable word processor.

Amstrad is making the claim in the week that it launches the Amiga version of its popular Protext word processor. The firm reckons that UK companies haven't recognised the machine as a business tool. "Most of the word processing packages have been imported from the States," explained Amstrad's Douglas Thompson.

He added: "I think UK software houses have seen problems with the disk drive and haven't bothered to persevere." Amstrad itself had a few hitches in development. Programmers were coming up against virus contaminated disks and losing days of work.

"They came across corrupted disks," said Thompson. "But I haven't seen any problem on the final product." Protext costs £99.95 and is already available on the ST, PC, and Amstrad CPC and PCW machines.

Amstrad is on 0733 238001. Review of Amiga Protext next week.

\* Amiga Protext: reversing a trend?

## AMIGA the video machine

Video and laserdisk dabblers are being pitched with a new interactive media authoring environment which can control VCRs and laser disks via an Amiga.

Although evidently a complicated and new area the use of video on computers is becoming popular in the US and is reaching the UK. British firm Microdeal has now launched its Riva program which can generate interactive video and laserdisk programs with the added bonus of acting as a VCR remote control.

Riva was shown at last week's Comdex show in Las Vegas to a reportedly good reception. With a price tag of £399 Microdeal reckons it will be put to best use by educationalists, enthusiasts and businessmen.

# WAR SECRETS HACKER COMES CLEAN

High profile hacker Edward Austin Singh has gone to ground after being hounded by the "sensationalist press".

However, he has detailed his future plans to Express now that police charges against him have been dropped. Singh is now working on a system to help large organisations and companies secure their data more effectively.

Singh came to the fore last month after it emerged that he had been hacking into British and US defence systems. He was caught after offering advice to the organisations which he had "bugged" and was investigated by the Serious Crime Squad and US

officials. Charges were dropped, mainly because he had done nothing illegal.

"I've decided to stop giving interviews and to concentrate on my serious activities," he said. "The only reason why I've been doing this is because I'm concerned about computer security."

Singh will be engaging with the framework of a security system in the near future. "Hacking isn't an end in itself," he said. "There has to be someone who can do more than produce lightweight security systems."

"The press appears to be more interested in the sensationalist side of

\* Singh: Now working for the system.

what I'm doing rather than what I hope to achieve," he said.

## New life for dead Speciecs

Budding computer repairers VSE reckon it's wooing dormant Spectrum users back to computing.

The South London business - set up recently by two youthful entrepreneurs - claims to be inundated with Spectrum owners wanting their machines fixed.

"So many of them haven't used the machine in three years," said partner Tim Morris. "When they went wrong the machines were thrown in the cupboard. But we're fixing them for people who want something to do in the colder months."

"We've been so busy fixing 8-bit machines that we've had to ban STs, Amigas and PCs. We're such a small company that it would be impossible to take any staff on yet."

VSE was set up partly thanks to the South London business initiative and a large financial backer which funds such enterprises.

\* VSE duo: Ian Vasey (front) and Tim Morris

The charges for getting your machine fixed at VSE range from £12.90 for a bottom of the range Spectrum to £31.90 for an Amstrad PCW. More details on 01 738 7707

## Watch it, Mac, you've been touched up

Durably computer companies will once again pulled up by the Advertising Standards Authority last week - mainly for the perennial problem of product unavailability.

Despite extensive requests from the ASA that manufacturers stop advertising products before they're finished, complaints still come through from irate

members of the public.

Vetrol computers were pulled up for inaccurate. The largest was Apple, which gained a slap on the wrist for claiming that one of its ads had been completely produced using Macs. A complainant exposed this as being untrue. The kit had been touched up with more expensive peripherals.

## Z88 zooms into Europe

A spirit of innovation which is prevailing at the Office Simulators Cambridge Computer with a flurry of overseas activity.

Its Z88 portable has just been shown in Germany and last October are being shipped into Spain. A Spanish launch already has under way before the end of the year. This will effectively make the portable available throughout Western Europe.

The machine is already used in the US and Australia - and the Middle East is being eyed as a possibility for next year. Cambridge insists and expects that even if it is launched there in 1989 or '90 the Z88 sales will be massive.

\* Z88: World view

## Snippets

### Anything to sell a disk

Manufacturers Model is offering a free Electronic Arts game - *Art of the Deal* - with each pack of ten 3.5" floppies intended for use on the latest high end PCs. Unfortunately, the offer will only run here if a disk proves a success in America.

### Special K pack offer

Owners of Kuma's K-Spread 1 and 2 for the ST can upgrade to version 3 for £85 and £30 respectively. Otherwise the spreadsheet costs £29.95.

### Newsbytes goes daily

Newsbytes, the "electronic newspaper" will be going daily from the New Year.

Currently a weekly, the service which is based in Telford, Shropshire and Merseyside is also undergoing a redesign in order to make it a daily must read.

### Eastern promise

Following hot on the heels of a patents deal with IBM, Taiwanese firm Mitac has unveiled its new range of 286, 285 and PS/2 machines. Due for only the 286s have been priced. They'll cost £1,099.

• Gold's Christmas box of goodies

## Money in the Making

Completion-rated US Gold has come up with a chocolate box style compendium comprising 15 games from its three years.

All the games included have charted (and quite a few of them have already appeared on at least one compilation). Titled *Library in the Making*, the compendium boasts the likes of *Beach Head*, *The Goonies*, *World Games*, *Quarterback* and of course *Leaderboard*. Gold reckons the games have sold around 2,300,000 between them.

Available on the Spectrum, C64 and CPC, the four-tape box costs £15, with disk versions £36.

# HEARTWARMER!

## Software houses unite for kids

The fourth games industry charity compilation will be appearing next Easter – and autistic children will gain from the proceeds.

Software houses in the UK are currently being wooed into submitting decent games for the compendium. It is hoped that the fall line up will be announced at the industry's Christmas bash in London. Activision, Ocean and US Gold are likely to make contributions.

Purposive software charity efforts have included *Soft Aid* which raised £300,000 for the starving in 1995. That still holds the record for the longest running Gallup number one dishing up 16 weeks. *Off The Hook* (to fight drug abuse) was launched in '86 raising £70,000 and then the comparatively disappointing *Kids Aid* last year which is said to have topped the £50,000 mark. That effort was dogged by delays and shoddy wrangles

between software houses.

A March launch is most likely since that will avoid the pre-Christmas flood of attractive games. Software publishers will have more time to prepare a compilation in the early months of next year rather than in the summer.

The National Autistic Society will receive all profits. That charity was chosen for two reasons. "It's obviously related to children in the main," explained Mediagames boss and charity organiser Rod Coombs. There's also a guy called David Rowe who has done a lot of work for different software houses and has a two year old son, called Alessio, who is autistic. It's a case of human interest related closely to the industry."

• Coombs: Helping hand

## Cascade dangles dangle at pirates

Fresh reports of the imminent death of the software pirate have reached our ears.

Cascade Games is developing a dangle – a device which plugs into a computer port and whose presence is verified by a program before it will run. The only way to game a piece of software supplied with a dangle – apart from cloning the dangle itself – is to isolate and rewrite the part of the program which

does the checking.

The new dangle will be offered to software houses hoping to float the code hackers. According to an optimistic Cascade, games utilizing the dangle will be so hard to crack that hackers will "throw up their arms in dismay". This, however, is not the first such claim.

"Piracy is ripe and any software house ignoring it is doing so at its peril," said

Cascade boss Nigel Stevens. "This will take games hackers so long to crack that by the time they succeed it won't be worth it."

He added that even if a hacker cracks one game it won't necessarily help him in his next venture. Stevens though was careful not to give any further information away. "We haven't named it yet and I don't want to say too much."

The dangle will be mainly

for use with 32-bit games. Stevens doesn't think 8-bit titles are worth protecting.

• Stevens: Pirates beware

COMPILED BY GALLUP

## Battle of the 16-bit ad-men

"I think, therefore IBM won't get my PC order"

• Amiga owners [proud as they are of their machine's graphics capabilities] must have been astonished at Commodore's latest television advertising extravaganza. Graphics displayed on the Amiga's screen would have taken thousands of pounds worth of video kit and packet packages to produce, perhaps slightly beyond the budget of a typical buyer.

The dazzling high tech graphics are, says Commodore, an attempt to break the mould of normally dire computer ads. Not a reference to Commodore's famous elephant, surely?

• This exceptionally aggressive line from Atari is the attempt to make the salt clad millions think twice before splashing out on an IBM. PCs have never been Atari's strong point and the firm is setting aside a fair whack (i.e. £100,000 on this ad followed by £2 million in the national press next year) in the hope that the business fraternity will be swayed from opting for the "safe" IBM option.

The ad blitz will culminate in the Which Computer? Show early next year when Atari will be praying for big orders.

## Mirrorsoft claims ST supremacy

If Microsoft is to be believed then more than one in five ST owners in the UK have bought Dungeon Master.

The game is alleged to have sold 30,000 copies since it was launched early last summer. Mirrorsoft has always maintained something of a high profile in the ST arena. The firm is selling Dungeon Master the best selling and most enduring ST game yet.

Last week the game picked up the Happy Computer award in France for Best Adventure with Microsoft; walking away with a total of four goings. Tennis was two (Best Strategy and Most Original game) and Palms was bestowed with Best Simulation.

• Vision Another Amstrad basher

## Vision PC takes on Amstrad

Yet another Amstrad-bashing PC will be arriving on the shelves soon courtesy of Vision Technology.

The Advant XT-10 costs £795 and runs at 10MHz with mono monitor, 640K of memory and a 30MB hard disk. A £1,500 XT is also to be unleashed with the bold claim that it's the fastest of its kind anywhere. An additional £300 will buy an SDA colour monitor.

Vision doesn't appear to be bothered that the market is studiously crisscrossed with low cost PCs of all shapes and sizes. "No-one else can offer that sort of price and performance," claims the Vision line. "I can't think of anyone who offers 30MB storage at £795 with one year's free on-

site maintenance."

Vision Technology has been around his some six years supplying kit from the likes of Olivetti, Compaq and Tandy.

## Murdoch takes Sugar

In their latest link up, media magnate Rupert Murdoch has called on Alan Sugar's firm Amstrad to produce a low-cost micro-based smart card decoder for subscription satellite television.

The card is to be designed by Amstrad technicians and produced by British firm Paytel. It uses microchips to decode scrambled satellite TV channels paid for by subscribers - they will receive a new card once a month costing around £10.

Amstrad is of course already closely linked to Murdoch's TV plans. It is producing a £200 satellite dish to access Murdoch's four channels.

## £10 off Beebulator

In a further attempt to get a foothold in the education market, Commodore has put forward a special offer as its new BBC emulator for the Amiga.

People involved in the education establishment can get a taster knocked off the normal price of £49.95.

## Apple's judge dreads

The highly publicised "look and feel" case which Apple has brought against Hewlett Packard and Microsoft has taken a curious twist.

Apple asked that the judge, Robert Aguirre, be removed from the Califor-

nia case when it emerged that his son works for Hewlett Packard. Whilst Aguirre insists that his son's employment has no bearing on the matter he has been replaced.

The look and feel case has attracted interest in all

sectors of the media since Apple's case rests on Microsoft's and Hewlett Packard's products simply looking too much like Apple technology. If Apple wins it could affect copyright law many other areas than computing.

# ROM for improvement

**C**D-ROM is one of those quirky (and brilliant) ideas which aren't likely to do anything immense for a good decade. Currently it is suffering from a good deal of poking and prodding from the technical fraternity but the fact is that as a mainstream device it's got a lot of growing up to do.

Atari's CD99 CD-ROM player may be the catalyst to break the vicious circle of hardware waiting for software and software waiting for hardware which pervades with all new technology. By launching the thing with the ability to play audio CDs Atari can rest assured that computer purchasers will have something to do on the gadget in the interim before good software comes along.

For the moment, CD-ROM is a compact disk which holds stacks of information as opposed to data from Street albums. Whack the completely inaccessable disk into your CD-ROM drive, connect up to a PC or ST, fiddle around with some software and lo, and behold, there's the Encyclopedia Britannica at your fingertips.

## What's on offer

CD-ROM is enormously useful doing the things its meant to. Journalists, engineers, lawyers, chemists all need piles of information at hand. The pages of a book holding the equivalent of 1500 floppy disks, 250,000 bytes of text, 5000 images or 16 hours of sound is appealing. In practical terms it's better than a study full of lovely empty books.

But, even though the likes of Atari can market a CD-ROM drive for as little as £299, the disks themselves are

Atari's CD-ROM: Will its dual function help break a vicious circle?

expensive. It costs so much to collate all the data and - initially at any rate - only a certain number of people are going to be interested enough to buy. Market forces dictate that the fewer the people buying something the more it's going to cost. So unless you all go out and buy a CD-ROM drive tomorrow it's unlikely that really useful and inexpensive databases are going to appear for a while.

At present much of what is on offer is very specialized: a lot of garb for a Boeing 747, all the drugs to cure Hepatitis, cases for the Crown concerning mortgage fraud. A more gen-

eral offering is Bookbabe! from Microsoft. It includes a thesaurus, dictionary, business information listing and literary style manual.

Eventually we might see things such as intelligent telephone directories (eg. tap in the phone number and get the address), all the hits in the pop charts for the past ten years (read the hits or tell up a clip from the pop video), or an interactive encyclopedia in which you flick instantly to the part of a subject that you're really interested in.

Then there are games. Much has been written about the possibility of fully-interactive games using precise video images stored on the disk. For example a space shoot-'em-up using video images from Star Wars. But such games are a long, long way off, largely because the creation of one would be more like producing a film than publishing a piece of software.

Nevertheless firms such as Cinemascope have long been sitting on the edge of their chairs waiting for the right technology to come along. And even the generally cautious US Gold is "making a feasibility study".

## A long way off

Another games software publisher, Virgin, prefers to concentrate on CD-ROMs more serious potential and is currently looking closely at the possibilities of adopting up the rights to various databases - what they are or what they might be isn't open to discussion.

"The volumes of CD-ROM drives here is crazy," says boss Nick Alexander. "Even in a worldwide basis. I'll take time to develop and I'd say there's not much in it for at least five years. But the technical superiority over a book means that a market will

Atari is poised to launch its £299 CD-ROM onto a bemused world. There's been plenty of talk about this new technical phenomenon but little action. Can Atari change all that?"  
COLIN CAMPBELL reports.

exist." Alexander argues that just to look for one reference may well be easier in a book but to look for multiple references would be handled easily by a five inch database. "To look for, say, how many goals a player has scored over the past twelve seasons would be difficult in a book because of all the teams he may have played for. But CD-ROM would have all the data there." Virgin has no concrete plans at present for interactive CD. "It will take a decade for the creative people to get to grips with it."

Alexander cites a "terrible" book from Microsoft called The New Playmate. It despatched a disk that a CD-ROM world is a long way off but puts forward arguments mapping out how, in the long run, it's possible that all our free works of literature could be on wee silver disks as opposed to books.

For Atari, technical man Les Player explains why the firm has delved into this new area. Is it the early bird syndrome? "Well, you can play audio CDs on it. My wife would never allow me to buy yet another piece of computer equipment but if it plays compact disks as well..."

It rings true that someone has to pioneer the hardware before software starts taking off. No doubt there are plenty of hardwired computer users waiting on bankruptcy who are just itching for an excuse to get CD-ROM. Atari has proffered the excuse in the form of dual purpose.

But, for those jumping up and down impatiently waiting for a game virtually the size of the universe - its worth noting right at the end getting used to what's on offer at the moment. The CD-ROM revolution isn't quite upon us. ■

## Questions & Answers

### How do I buy a CD-ROM player?

Without wanting to put too fine a point on it - you've got problems. Major CD companies such as Philips and Hitachi have players but they're in the corporate price bracket. And Apple has a model - that though a pity for the Macintosh.

Atari's £399 offering arrives next year and - according to the company - will be easily available. Atari reckons it will sell more than 10,000 units by this time next year. By then you may be able to get it in the High Street. It would be foolish though to rule out delays.

### Will it work on my machine?

The standard Philips range of CD-ROM drives will work with any MS-DOS machine without headaches. Atari's is made with the ST specifically in mind although an interface will be available to hook it onto a PC. Other machine owners may have to wait for interfaces to appear from either Atari or from third party developers.

### What applications are available?

Not many and they're expensive. The Encyclopedia Britannica in book form costs something like £500. They're not going to sell that info on any medium for much cheaper. The very near future will almost certainly see the CD-ROM based dictionary and thesaurus, with less general databases appearing in the fullness of time.

For programmers there's loads a CD disk holding a plethora of manuals. Developed by Microsoft it's currently only available Stateside where it costs \$395.

### How useful will CD-ROM be to me?

If you need a lot of data at hand then it'll be a godsend.

The trick will be to know how to take advantage of indexing. You'll want to customise your machine and CD-ROM so that info can be found swiftly.

It's worth remembering that you're really only dealing with a great big hard disk drive.

## AMIGA SPECIALISTS

### ACCESSORIES

<b>Floppy switch box</b>	39.95
Connects up to 3 drives. No need to turn your computer on/off to disconnect cables.	
<b>Click Cartridge</b>	65.95
Takes 4 seconds, no soldering. Battery backed up clock. Retains time and date.	
<b>A1000 Kickstart 1.34 disk</b>	149.95
Plugs into expansion port. New version kickstart. Battery operated clock.	
<b>A500 Kickstart 1.34 disk</b>	69.95
Easy to fit. New version kickstart. Verus protected programs.	
<b>Boot selector</b>	12.99
Substitutes between internal drive.	
<b>Epson programmer</b>	149.95
Easy to use. For A500/1000/2000 (state models). Programs 276A/2712B/2725B/27512. All A/CMDs codes. Complete with software.	

### GENLOCK A500/1000/2000 (STATE MODEL)

Professional genlock, easy to use.  
Low cost, enabling you to merge computer graphics with live video & record the results on a VCR.

**1269.95**

**NEW**

### MUSIC

<b>Midi interface</b>	29.95
For A500/1000/2000 (state models). Compatible with leading packages. Midi in, 3 midi out, midi thru.	
<b>Sound digitizer</b>	39.95
For A500/1000 (state models). Compatible with leading packages. Connects to parallel port. Also for music & speech digitizing.	
<b>Professional sound digitizer</b>	99.95
The ultimate stereo sound digitizer. Makes the others sound like toys. Compatible with leading packages. For A500/1000/2000 (state models). Connects to parallel port.	

### HARD DISKS A500/1000/2000 (STATE MODEL)

Supplied ready to run. Built in power supply. Includes cables and software. Compatible with ram expansion units. You can clone your internal version of the hard disk unit.	
20 mbabyte hard disk	499.00
30 mbabyte hard disk	599.00
40 mbabyte hard disk	699.00
60 mbabyte hard disk	799.00

### RAM EXPANSIONS

<b>A500 512K ram expansion</b>	129.95
Upgrade to 1.5 mbabyte. 105600 in seconds. Plug into expansion port. With clock, battery operated to retain time/date.	
<b>A500 1.5 mbabyte ram expansion</b>	179.95
Same as A500 512K ram expansion, except uses 1.5K 3.3 mbabyte ram chips. Flash chips not supplied.	
<b>A500/1000 8 mbabyte ram expansion</b>	599.00
Fitted in seconds. An additional empty slots into expansion port. More space for data and programs. Faster program execution.	

**NEW**

### EXTERNAL DISK DRIVES

- \* Top quality Western Digital mechanism.
- \* Through port for data sharing.
- \* On/off switch.
- \* With or without track display.

## EXPRESS

## ● PARTLY POLITICAL BROADSIDE

Forgive me for being a little slow in picking up your new publication. I mainly use a PC while using a BBC and PCW at work so your magazine has obvious attractions for me. I especially liked the article on graphic displays as it compared PC graphics with other machines (why no mention of the BBC?). More such comparative articles, please.

Regarding your article on CITS and Archimedes, surely schools have been lumbered with Acorn for long enough! Despite the obvious immorality of the principle behind CITS it seems a pity they are unable to learn from state schools.

OK, Archie are superfast. OK, they have virtually no software written for them which takes advantage of this speed. OK, you could probably buy three PCs for the same amount it takes to get an Archie running. Apart from that, what's the news story?

The news story was the abysmal ignorance revealed by all three of your 'voices in the debate'. The politician revealed astounding bigotry. The Head showed no understanding of IT. The industrialist seemed to think that schools should train his workforce. We already know that British industry has the worst training record in the Western world. Why do people like Alan Carter think this is the responsibility of the schools?

Is it any wonder that, despite high productivity, British industry is out-performed by its competitors when such crass opinions are expressed by those in managerial positions?

Part of the solution would be to dump all Acorn products on the Primary schools, where they belong.

Install PCs in Secondary schools. This may be lumbering Secondary schools with a technology that is currently being superseded. It does, however, provide a way ahead. PCs are expendable. They are a more realistic technology than the currently entrenched Bbit dinosaurs.

**Bil Brooks, Eastbourne**

✓ You haven't really been that slow. You're talking about Issue One. 2. The graphics piece didn't mention the Beek for the moderately valid reason that it was analysing graphics standards on the PC. 3. The Abiding Arcadia/education connection has doubtless caused much merriment to a certain Cambridge-based computer firm, whilst baffling or even exasperating the rest of the world. Presumably there was once a semblance of logic in the original thinking. These days, the connection is nothing short of perverse.

Congrats on your prize - we're sending you a wonderful PC package from Epya called Print Master.

Here's your chance to contribute to the liveliest, fastest computer forum in Britain. Write to us about anything to do with computing - just so long as your letters are interesting or angry or opinionated or entertaining or, failing that, short. The week's most impressive epistle wins a mystery prize - we try to make it appropriate for the person concerned.

Write to: Express Mail, 4 Queen Street, Bath, Avon BA1 1EJ Yours,

**The Express Editorial Gang**

PS. Our replies are prefaced by a tick unless we wholly disagree with what you say. Then you suffer the disgrace of a cross.

PPS. Sorry, folks, no personal replies. We'll print it or bin it.

**Julian Rivers, Telford Holdings, Whiteley**

✓ Give PD Systems a call on 01-440 1130. If they're pleased to hear from you, tell us we sent you. If they aren't, let us know how they get on.

**FLAME'S FAIR**

Hey, nice mag. Rain rings around Commodore Gamesweek (That's enough damming with bait praise - Ed. But what's happened to the Flame One computer? It was reviewed in ACE not long ago. Could you please give us an update on any unreleased machines such as the ST Plus, 32-bit Amiga and the PC Engine, or at least confirm their existence. Will Flame really come back into fashion?

Many thanks.

**Wills Judd, Swenstone, Staffs**

✓ Computers divide on the Flame. Either it is an extremely exciting technological breakthrough that should set new standards for games machines and should be appearing at some stage in the near future, or else it is an extremely exciting idea that will never appear in a commercially saleable form. As Express revealed last week, elements of Flame's work will be appearing in the new Kase console, which is a small marvel for the legions of Flame fanatics to get their teeth into.

Other machines: all exist (and not just in the minds of their weak-kneed sellers, first assumed that Express will be the first to carry the details of the eventual UK launch.

**CBASE CHOICE**

By December 5th I have to find out as much information as possible on Cbase II and its history, which they do, and their applicability to given situations. Needless to say the few books in my college library (disappeared before the lecture had finished speaking, and very little appears to have been published in any case. It would appear that Cbase is November 3rd deadline has come and gone, and so far all I have seen is an advert in your magazine quoting a price tag of £472.13.

I am studying for an HNC in Computer Studies at Norwich City College and I would appreciate any help for any ideas where I

can get any. Instead of a Christmas test, we will be required to write a report - the format to be given just before the last starts - and also cope with demands for information to be given there and then, just like the real world.

As I am just finishing an assignment on the subject of the operating system. Your explanation in New Computer Express will furnish me with an extra source for the Bbitography and perhaps a bit of one-upmanship. I shall find it very helpful.

Long life to your new venture.

**Jacqueline Denny, Norwich**

✓ One obvious line of enquiry would be to phone the firm behind Cbase, Ashton Data on 0628 33123. Alternatively, Microsoft Press (0734 291123) published a useful little number called Programmers At Work, including an interview with the original Cbase author.

Aside from that, probably the most useful lesson to be learned about computing is The First Rule of Software Publishing. This states that regardless of the honest intentions, the more specific a publisher is

53

## PLUS POINTS

Please could you tell me what kind of computer the Commodore Plus/4 is - eg, an 8-bit or a 16-bit machine? And please could you tell me where I can order software, or if I can use any other kind of games. And please tell me if I can use my computer as any other kind, if so please tell me how.

A. Redmayne no address, the why thing!

✓ In the great scheme of things, the dear old Plus/4 is really more of a two-bit computer than anything else. Technically, it's an 8-bit beastie, and a pretty much dead end at that.

C16 still is the only other software you can run on the Plus/4, and there's not exactly a deluge of that around these days. Capl Marketing on 06285 21244 should be able to help.

No, the Plus/4 cannot be used as 'any other kind' - not unless you bolt an Amiga onto the back and then throw away the Plus/4.

## LAYERS DRIVE ON

I was so interested the article by Richard Morozio in New Computer Express of November 12.

I have written to Supra in Oregon, USA to inform them that Third Coast Technology Drives are indeed brand new as is every other component used. I have further informed them that unless a retraction is

published in yours and like magazines forth with, I shall have no choice but to instruct our American lawyers to sue.

TCT, a subsidiary of Western ISC (Europe) Ltd enjoys excellent purchasing facilities within the industry, which allows the low prices to be passed on to the customer.

I trust this sets the record straight.

JC Muller, Welwyn SC Europe, Wigan

✓ What a run-station indeed! Here we are in all good faith passing on the claim that it was quoted as a claim from Supra's UK agent Frontier over Third Coast Technology, and then all of a sudden in learned friends in the legal profession are not to get involved. Perhaps Frontier now mean saying what it did. Otherwise, our mail service will be assured shortly.

## IN SEARCH OF TOOLS

I have read through your previous issue of New Computer Express (free with December issue of ACE) and my attention was drawn to an article on page nine under the heading of 'Finding the right tool for the job'.

We are a software development company with a major part of our work based on Z80 hardware. I would therefore be interested in finding out more about the Programmer's Development System described in the article, and would be pleased if you could forward the address and phone number of the manufacturer of the system to me.

✓ DON'T KNOW WHAT WE DID BEFORE NEW COMPUTER EXPRESS CAME OUT

about the date for its next product, the more likely it is to be late. Usefully, it applies across the whole gamut of software firms, from budget games publishers on up to the serious full-blown companies.

#### THE GREAT DEBATE SCOTCHED

First off, congratulations your first issue. I have been looking for a magazine which not only covers games but also news and coverage of the whole computing scene. And weekly too!

Secondly you're bound to get the usual letters from G54 and Spectrum owners slagging off each other's computers. I can add a tip to this before it starts! I own a Spectrum +3 and my brother has a G54. They are both really good computers and, as yet, not worth selling for 16-bit machines until those are properly established and their prices have come down (both hardware and software).

**Gary Chase, Selwyn, Surrey**

First part's the best: the whole of the games hardware scene summed up in a few sentences. The Spectrum and G54 are equally good, and both are better than any 16-bit system. No doubt the vast legions of Express readers will all agree.

#### SOMETHING I LIKE

As innocent as the day is long I slipped into my local newsagent and something caught my eye. A quick as a flash thought "that's different!" Yes, it was different. At first sight it looked like another magazine, but the price was wrong - 48p. So let's give it a whirl.

I have found something I like. I purchased New Computer Express at about 17.30 today, and it is now 23.30, so I have obviously been motivated to sit down and get this diatribe.

What I found about the magazine was a layout and presentation that appealed particularly to me. I do have criticisms of a minor nature that may be worth pointing out, but generally I liked the price, the presentation and the balance between the articles.

I am a confirmed Sinclair addict, having been into the discolorable line through the MK14, ZX80, ZX81, Spectrum G own the "Fiddlers delight" model - ie the one so early in the production range that it has pots and preset characters that can be tweaked. But I also own an Amstrad 12

#### A NOVICE WRITES...

I noticed your article for beginners in New Computer Express, and thought that this is exactly what I need. Having no experience, and no computer, I am at a loss to decide what to buy. I list below the relevant criteria and would ask for your suggestions regarding type and make of computer.

- A = Price guide - up to £350-£400.
- B = I am 14 and have just started learning about computers at school and I am interested in programming.
- C = Games.
- D = Educational - I also have two sisters six and eight who would probably use it.
- E = Should I choose a monitor or use colour TV?
- F = I would like a disk drive if possible within price range.
- G = I use a BBC B school.

I hope you will be able to assist me in making a good choice as I find all the different computers available very confusing.

Good luck with the new magazine, I'll certainly be buying it.

**Matthew E. Medley, Uppington, Essex**

Choosing a computer can be a bewildering and sometimes frustrating experience - that's why we presented the completely guide to selecting a computer that's right for you in last week's issue.

In that guide we recommended the Atari ST as the best all round choice. But because of your circumstances the Amiga would probably be a better bet - it's just within your budget.

The Amiga includes an excellent version of Basic and you can buy other programming packages - normally priced around the £50 region.

The current situation for games on the Amiga is very encouraging - you won't get better graphics anywhere. Software is expensive though, the average price being £25.

Connectors is due to bring out a £50 BBC emulator for

£12K 000, have access to an Amstrad BS12 and recently purchased - Special Offer. It's a Bargain - a Spectrum 128.

I am not a real computer games player, although I find some of the games' situations quite addictive. I don't seem to be a shy but almost all the magazine articles and software available for the Spectrum are all aimed at games players rather than those with more serious thoughts in mind. The same is probably also true of the majority of software available for the more popular computers.

As computing in all its aspects is my main hobby and it is also important in my

work, it is fairly critical for me to be aware of the current trends in the marketplace. An in-depth study of everything available is obviously not possible, but an indication and/or opinion from New Computer Express will give me a lead to areas that would require further investigation.

I do get very annoyed with the electronic jargon that is used in much computer literature, in particular CP/M and MS-DOS. My background is technical electronics and I find MS-DOS (I use it) Simple, Straight and easy to work with.

A prime example of this my complaint was that after spending a number of hours

reading through a massive tome that claimed to fill The Complete... Reference Manual, I appeared to be on the verge of discovering the information that I had been searching for only to come across the sentence "that of course is beyond the scope of this manual".

I would like to see an article being made on this front with The Learning Curve in Express.

I do hope that this magazine can continue to improve on its original form. At the moment I like it and shall continue to buy it. **M. Diamond, Guildford, Surrey**

Express also stands for Keep it Short, Sharp! ■

## ● THE GREAT PURCHASE DILEMMA

the Amiga early next year, allowing you to run most BBC Basic programs from school at home - an obvious attraction. However it's not yet clear how many commercial BBC software packages the emulator will run. Your younger sisters will probably find it as easy (or difficult) as any other computer - it just depends what software you have running on it. The Amiga's 74k display is OK for many uses, but if you really want to gaze at the graphics, try to save up another £300 or so for the colour monitor. Next year, perhaps?

#### ANOTHER NOVICE WRITES...

Could you advise me as to 1st timer a good computer to buy? I would like to use it in conjunction with my small business so I would like it to have word processor capabilities, have a disk drive and use a colour monitor. Finally my daughter of 6 has started to use a computer at school so I would like her to be able to use it for games and learning BBC compatible. I do hope you can help.

**S.R. Fay, Sarisbury, Surrey**

If all BBC compatibility is crucial, you'll need to buy a BBC machine. A 1284 BBC Master computer with 3.5 disk drive, 14 inch colour monitor and Acornsoft Winemaster Professional word processing software would set you back about £550 or VAT.

However, if it's mainly for business use, you'd be much better off buying a PC - for example the Amstrad PC 1640 (literally with a hard disk drive). It may only be word processing you want the machine for at present, but having a PC will give you the option of doing virtually any business task you like.

There's a growing range of games and educational software for the machine, and you can get some crossover with the BBC through a £100 software package called BBC Basic 86 discs M4 Tec on 0603 8706200.

### MSXTRAORDINARY I

In MSXtra in New Computer Express it was said that MSX 2 machines are still scarce in this country. But I know of a source - VideoQuip in the Midlands - that is still selling the old MSX 1. The particular model they sell is the Pioneer PK 1 which has a built in ZX81 compatibility.

This company bought the entire stock of these machines when MSX flopped a few years back. I am reliably informed that they bought approximately 30,000 of them and have been selling them in this country for the last two years. They are particularly good for those video taping machines because of the GEN/CLK on the MSX1, I would estimate that there are between 10 and 15,000 machines being used in this country by video

enthusiasts.

There has been a lot of fuss about desiccated videos on the Amiga in recent months. However, what is not usually mentioned is the quality of most GEN/CLKs for the Amiga. They are usually designed for the USA and are therefore only really good to the MSX1 standard. For a decent GEN/CLK on the Amiga it costs about £500. The GEN/CLK on the PK 1 is of good quality and is far better value than the equivalent Amiga system.

You may wonder why I have mentioned all this and no I don't mention the above mentioned company. The reason is that I haven't read a good MSX model in ages. I've got more useful info out of your column than most other magazines weeklies at

70p, so you are mentioned twice in their entire news section. Therefore I thought I'd give you some interesting back.

**Ian Harrison, Chichester, Lancs**

It's one of the oddities of the computer world that the MSX owners are still so vocal about their machines. If all the other owners of all the other machines made half as much noise, we'd all go deaf.

Still, you probably have to make a sackful when so few of the commercial companies have been looking for so long.

We'll doubtless have yet another MSX article appearing immediately after this one.

### MSXTRAORDINARY II

Congratulations on a very interesting magazine. I had never heard of New Computer Express until I read about it in ACE, so I am not sure how many editors you have published. How much is your yearly subscription?

I am pleased to see New Computer Express supporting the MSX, and noticing that it is a computer with a lot of potential.

I am an MSX magazine called MSX Gazette and would like to know of any addresses which could be of use to me. If you would like to let your readers know of MSX Gazette, I would be most grateful. Here is a little information on my magazine - No there isn't. That's enough playing. Don't MSX Gazette has also started a tape club free

membership for MSX owners only. I am not only MSX 1 tape programs are accepted, although we are planning to extend to the MSX2, and to the MSX2+. In addition, I should soon have speech incorporated into my programs. The tape club is called MSX Streaming Games Billing for short. We are looking for programmers to write some good software for us.

Thank you for supporting the MSX. Keep on the good work.

**Robert Wilson, Hastings**

Express was born on November 12th, 1988, after its previous issue had been funded with ACE. 2 Subs are so ridiculously worthwhile that we've already had profits of blank

cheques on the off chance that they are a millionth. But what is definitely not open to doubt is that an Express sale of just £24.95 annually represents an extraordinary bargain. Hasn't it? Use the card on the back of this issue.

I've often thought I'd go as far as to say that the MSX has a lot of potential - I only because of the lack of support have most UK software houses. I've just agreed that it has a lot of potential to be writing supporters.

4. MSX Gazette sounds like just the sort of publication for us, so do send a copy. To save you all writing to MSX Gazette here at 27 Redwood Road, Hastings, East Sussex TN38 8DW.

This has been a public service announcement.

# He's got his own

In the first of a major Express series, one-time Amstrad man William Roel charts the early days of the

## The Alan Sugar Story

**B**estrooms. Not exactly the most prepossessing of objects, and not exactly the most obvious basis for the greatest commercial phenomenon in the UK computing world. But bestrooms it was that started the young Alan Michael Sugar off in his quest to make incomprehensibly huge piles of cash as quickly as possible. And never underestimate a man who can turn the oddest of vegetables into money in his early years.

Alan comes from a very typical East End background, born (under lady states) in 1947 in Hackney. Both parents worked in the rag trade, but from an early age young Alan caught on to the opportunities that went around to all to make a just about anything when a market can be found. The tale of his early business exploits are larger and legendary in the classic "East End boy made good" style of anecdote.

Alan's first trading exploit was to boil beetroot for the local greenhouses, getting up at a hellacious 10 dark both of the early morning to do so. Then there was the photographic phase and the rapidly aging of bulk film. Moreover he obtained a number of C-levels, and although stories differ on this next point, I believe he also has three science A-levels.

But whatever the actual detail, it should be clearly understood that despite his cultivated street trader approach to business and his dexterity for intellectuals and "bottlers", Alan Sugar is an academic at heart — one reason why he manages to maintain the whip-lash so readily over his suppliers and staff. Never underestimate his mental agility.

Had he been as motivated by the prospect of certificates and academic achievement as he was by money, he would be a professor of his chosen subject by now — and about £500,000,000 poorer.

Money was made down. Since his family background was by no means deprived, the Legend of Alan reveals no particular motivating force for his desire to get his shovel into huge mountains of money other than a larger than average desire for the better things in life. And rather more of them than the rest of us, please.

### Aerial assault

Alan moved along into another good Jewish tradition in the East End, and worked with an electrical wholesaler. This led to the famous phase of selling car radio serials from the back of a van, and many small electrical shopkeepers around East London can remember the days of having to give that energetic young lad a shove to resist his was (why pay good money for a new battery when you can get someone to shove it for free?). From there, it was a short step to wheeler dealing at that notorious stock of high tech tick tacker, Tottenham Court Road.

By keeping overheads low and applying his brilliant salesmanship he could force Alan Michael Sugar Trading by the age of 21. And using his astute observation of the marketplace and where opportunities arose, Alan had launched into several niches in the audio trade.

After the legend of the serials came the legend of the plastic record player covers. A £5,000 investment in tooling produced a player top for around

50p a moulding, and this sold for up to £15. This confirmed in the young Sugars mind that the way to make serious money was to make huge profits, and to avoid any use of his rapidly growing capital that did not reflect around a 10,000 per cent return.

This was an important ground rule found in the corporate philosophy. If you can't earn at least 30 per cent from a product, get out, and find somewhere that you can. And the other byproduct in his philosophy: the world is full of swags willing to work for peanuts, so let them.

Today's Mr Sugar also kids his audience that attention to detail was one of the factors in Amstrad's success. Frankly (a favourite expression) that is a load of crap (another favourite expression), attention to detail only came with his companies after getting a severe drubbing in the audio market because of a total lack of attention to detail.

### The Mug's Eye-fall Tower

Anyone who ever owned one of the earlier Amstrad audio products will realise that the next step along the road for Alan was the conception of the Mug's Eye-fall.

The Mug's Eye-fall is where Alan's brilliance really starts to show. Take an expensive audio product, reproduce its inside, show it something salvaged from a shiny radio chassis, and the lucky driver and his mate will come flooding. It's just like the back of his hand sets where the foot of the Gosh With The Wind maracas is in fact a plywood mockup, propped up by a load of lard by two.

The equipment looked a million dollars, but actually ran very little. Outside at places like Acorn and Raintonbrowns were sold the product by Sugar's expert endorsement, and the trip sounds (known as a public company was well under way).

Basically he looked at the Japanese route to success and did a very effective imitation for himself. He might correctly be described as Britain's own economic rapscallion.

But all the time the kitchen piano was playing tentatively away in the background, Alan continued to take short cuts with elegance and the finer points of English management technique. His abrasive and direct manner led to problems with the old school, although all those with whom he does business have nothing but praise for his integrity and reliability.

Sugar's general view of business progress is based on need-to-know. He managed to surround himself with a relatively unqualified but highly loyal staff who exhibited the key ability to learn as they went along (with a couple of exceptions). As new markets appeared and new products were devised, Amstrad boys picked it all up as they went along, but computers were a different thing as we shall see.

However, the closing of the expensive look took a step back when blatant copies of one expensive Japanese indecipherable design led to an order to destroy a ten or two of the Amstrad look-alikes. This lesson was well learned and Alan thus took a closer interest in copyright laws and made very certain that when the fuzzy into IBM land came along, he was properly prepared. Before then, though, he had a more elementary hurdle on his hands: how to launch Amstrad as a computer manufacturer, just when the bubble was beginning to burst for Sinclair, Commodore, Acorn and Amstrad.

## This charming man

Alan Sugar is impulsive personified. He usually doesn't bother to say "Good Morning" on his humdrum progress through the building to his penthouse. The debate as to whether this is social boorishness or an economic obsession with the myriad pressing matters that surround a huge business revolving around one man's judgment continues.

It's quite possible that Sugar feels that manifestations of common courtesy after all this time would cause serious concern that he's getting soft in his old age. In his personal life (very well hidden from his public life), he is a model family man, with a stable marriage that goes back to the days before anyone could possibly accuse him of marrying the old man for his money. This tends to support the view that Sugar's actual behaviour is a carefully studied and cultured approach to eliminate and inspire.

Insane he certainly does. His core of long term staff (there's continues to treat him with a reverence usually reserved for a religious leader. In a way, this is a serious problem, and the object of worship at Amstrad is profit. The burning question is whether or not the operation is so utterly obsessed with profit that the Amstrad mob would desert him armed robbery if they were 100 per cent certain they could get away with it.

Uncertainty on this score is what probably annoys many of the gentler city observers, whose own particular brand of learned robbery has a social acceptance amongst their peers.

## The five quid a second approach to making money

Let's get one thing straight. Alan Sugar deals with computers much as he does any other commodity, as a means to an end, and the end is profit. Huge, gargantuan, unimaginable and enormous amounts of it. Amstrad regularly achieves the impossible in terms of the net margins it maintains on its trading, doing at least twice as much as conventional wisdom would believe possible.

The profits accrued are too huge to be meaningful. In its last reported figures for the 12 months to June, Amstrad made £160,400,000. That's the equivalent of £839,452.25 each and every day of the year. Or to put that another way, Alan and the boys make £18,310.50 per hour, even when they're not working. And further, that makes £305.18 per minute or even £5.09 per second less into the Amstrad coffers.

So by 9.00 am on January 4th 1989 when most normal folk will only just be starting the year after the holidays, Amstrad will already have reportedly earned the pretty sum of £1,483,150.55...

# CHRISTMAS JUST WOULDN'T BE CHRISTMAS WITHOUT THE ATARI USER SHOW

ALEXANDRA  
PALACE  
WOOD GREEN  
LONDON N22

NOVEMBER  
25-27  
1988

Too early to think about Christmas? Not when it comes to the Atari User Show.

*For this is the festive event that has it all:*

**LOADSA exhibitors**  
(around 70)

**LOADSA hardware**

**LOADSA software**

**LOADSA new products**

**LOADSA games**

**LOADSA happenings**

**LOADSA technical advice**

...and most important of all for you, the visitor —

**LOADSA bargains!**

With hundreds of special show offers to choose from, here's one place you can do your Christmas shopping and end up in pocket.

You can even save £1 a head before you get there by using this advanced ticket form.

*If you enjoy computing with Atari, you'll be thrilled with the Atari User Show!*

## SHOW HOURS

FRI-SAT 10am - 6pm  
SUN 10am - 4pm

Bring this coupon to the Show to get £1 per person off the normal admission price of £5 (adults), £3.50 (children).

**ATARI  
CHRISTMAS  
SHOW**

Friday, November 25, 10am-6pm

Saturday, November 26, 10am-6pm

Sunday, November 27, 10am-4pm

The West Hall, Alexandra Palace,  
Alexandra Park, Wood Green, London N22

Valid for up to four people

No matter which Atari machine you use from the 8-bit through to the mega ST you'll find just what you are looking for. And even some exciting things you didn't know existed!

For all the leading companies in the Atari market will be out in force to demonstrate their latest developments.

Traditionally the liveliest Atari event of the year, this pre-Christmas show is shaping up to be the most entertaining of them all.

**Don't miss it — and make sure YOU enjoy a Merry Christmas!**

## How To Get There

Alexandra Palace is so easy to get to by car, rail, underground or bus. It has its own British Rail station, just nine minutes away from King's Cross, and there's a free bus service shuttling between the station and show every 10 minutes.

If you're travelling by road, the show is only 15 minutes away from Junction 25 on the M25. Car parking is free.

# Carrying all before you

*Peter Worlock presents a moving guide to the world of portables*

**C**arrying all before you has always received a disproportionate amount of coverage when mentioned against public interest, largely because it is computer journalists who are most in love with the idea.

But portable computers have come into their own in the last year or so, with industry giants like Apple, IBM, Compaq, Toshiba and Sharp offering products from tiny hand-held machines, all the way up to desktop systems that you can carry around with you.

There remains the question, though, of whether the ordinary user deserves the manufacturers' enthusiasm. In a general, mobile sort of way, we're all now as all-powerful, fully-featured computer the size of a Walkman stereo, but today's machines are a long way from that dream.

The question is - allowing for compression - what can a portable do for you? Could it change your life? Do whole new vistas of computing power and flexibility stretch before you? Or are portables just another way of separating you from your money?

## Points to ponder

The difficult thing about choosing a portable is trying to clearly establish what you need, and that will depend not only on what you intend to do with the machine, but how you intend to do it.

For example, if you want to literally compute on the move - the rather clichéd scenario of the businessman writing his sales report on train or plane - your choice will be very different from mine, when what I want is a machine I can simply move around from home to head office, to branch office,

## Portable portraits

### Michael Maykit: The Salesman

A go-ahead, thriving salesman, Mike will definitely make it in the corporate future thanks to his portable PC-compatible.

Because he drives everywhere he doesn't need a battery-powered laptop, but his computer goes with him on visits to his clients, and he can treat a hotel room as if it were his office.

It allows him to keep track of all his sales leads while he's out on the road. Through its built-in modem he can hook up to the company's mainframe back at head office and get instant and up-to-date information on product availability and delivery schedules - which impresses his clients enormously.

And he can stay on top of the paperwork: the computer's integrated software lets him view information from his database, spreadsheet and graphics program with word-processed documents. When he returns

to the office, he can simply print out his monthly reports while his rivals for promotion are still writing theirs. Bad news for them, great news for Mike.

### Doug Drybones: The Archaeologist

On his last dig, Doug made use of a small battery-powered laptop which gave him computer power even in the middle of nowhere. Doug didn't need to juggle the information; instead he was able to record details of site surveys, led to record the location, description and measurements of every ancient artifact found during the excavation.

His needs meant he could dispense with expensive (and heavy) PC-compatibility - important when you're on a limited budget.

All of the data was stored on EPROM cartridges, which don't suffer the high power consumption of hard disk drives, and have no moving parts to be clogged up by the

dirt that is so much a part of the archaeologist's professional life.

Later he transferred the data to his desktop PC, where began the important task of analysing the myriad bits of information, and integrating the results ready for publication. So successful was the project that his academic past spawned the profitable documentary TV series, and the ridiculously lucrative movie starring Marisa Ford.

### Sue Yerasov: The Lawyer

Legal eagle Sue found that the price of success was late hours in the office. Unfortunately, leaving work when most people were leaving the city meant she ran the risk of burning into one of her many clients - the habitual nagger and party-sourter Stanley Nyle.

Sue solved the problem by buying a laptop PC. Now she can leave the office on time and carry on working at home. And during that odd hour or the 5.15 from Wandsworth she's writing her grievances to be a best-selling crime thriller starring all of her unsavory professional acquaintances. After all, a good-for-nothing character like Stanley should be good for something.

TRADE ENQUIRIES WELCOME

**"DISC" OVER MICROSNIPS ARE BEST!**

to home again.

To help you decide, here are five questions that should point you in the right direction.

#### 1 Do I want to commute on the move?

If the answer is yes, then you must have a battery-powered system, and that brings limitations. Although you can run large screens, floppy disks and even hard disks from batteries, you won't get very much use between recharges.

If the answer is no, you can widen your choice to include machines that require main power but remain more or less convenient to move around. The Osborne 1 was the pioneer in this respect, and even the Apple Macintosh qualifies, as do most Compaq machines. The key feature is that the monitor is built as the main unit.

#### 2 Do I want a real computer?

A "real computer" in this sense means a machine that can run software like a word processor, a database, a graphics program. For that, you obviously need a full-size keyboard and reasonable display screen.

If all you want is to enter data without processing it, or to have access to data entered earlier, back at the office, for example, you can save a lot of money because you don't need large screens and keyboards. You could use something like a Palm Organizer.

#### 3 Do I want to run my favorite software?

If yes (hush, aren't you), your choices start to slim right down. You have to realize that in portable computing, there's PC-compatibility and other standards at all. That means if you're a Macintosh, Amiga, Atari ST or BBC owner, you simply can't run your favorite software on a portable.

If you have a CP/M machine, you're just slightly better off because there are CP/M portables, like the PDA P88. However, there have largely been discontinued, although you can still find them secondhand. You won't be able to run all the software you want, but at least you'll have WordStar and one or two other CP/M favorites.

If you have a PC, then you've got the widest choice, but there are still limitations. For example, if you're planning on running your standard corporate spreadsheet, you might find you'll run out of memory before it runs on a portable. Or you may prefer software right to be close to unusable on an LCD screen in poor light.

#### 4 Do I really want a full-powered desktop I can take with me?

It's not out of the question, but you'd better be prepared to pay for it. As a rule of thumb, portables will cost you roughly twice as much as an equivalent desktop PC. That's largely because components for portables—low-power processors and memory chips, disk drive controllers, etc.—are much more expensive. And the packaging engineering needed to cram everything into a tiny space doesn't come cheap either.

#### 5 Do I just want to take work home from the office?

Think carefully about this one. If the answer is yes, you can save a lot of money and inconvenience. Because now you can buy just about any computer you want as long as it will read data from your office PCs: Atari STs, Amigas, Acorn Riscos, Apple IIs, BBC Micros, and Macintoshes all qualify with various bits of mid-on hardware and appropriate software.

Note that you don't have to be able to run PC software; all that counts is that your home computer can read and write data to a form the PC can understand. Now the only thing you have to take around is a floppy disk.

### Brave New World

Choosing a portable can be more difficult than choosing a desktop computer, because portability raises some unusual issues and provides some odd solutions. You not only need to understand computers, you need a clear understanding of what your work entails, and how a portable might help.

But once you've made the right choice, portables can bring enormous relief.

If you're a consultant, the time you spend on trains, buses and planes can be wasted time, a battery-powered laptop could give you an extra two or

three productive hours a day.

If you're a moving worker, constantly moving between offices, visiting clients, staying at hotels, attending conferences, a portable can not only increase productivity but also allow you to take your office with you. As the old song has it, "wherever I hang my AT, that's my home."

If you're often required to work late at the office

to clear your workload, a portable could give you home rather where you can carry on working. Of course, that doesn't equate to more free time, but at least you might see your kids before bedtime.

If most of your work is done in places away from national grid power, a portable you really don't have much option but to go battery-powered.

Portables are a workaholic's dream come true!

# I Spy Portables

## The Hand-Held Machine

• Palm Organizer — the most portable of them all

Best known in this category is the Palm Organizer. Battery-powered, and about the size and shape of a Walkman stereo, the Organizer is loaded by an LCD screen, just large enough to show a numeric keypad. There's a full alphanumeric keypad, but you need nifty fingers to use it, and you wouldn't want to use it for more than a quick calculation, or to enter the briefest of notes.

Software includes a database, reading list and stock market program, and a hardware-software pack for converting the Organizer to any computer with an 80232 interface. There's a black leather shoulder holster for carrying it around, if you're the thick-skinned type who can ignore boots of denim leathers.

Prices start at around £300 for a model with 8K of RAM, but essential extras, like more memory and the comes pack, quickly take it over £300. But computers don't come any more portable than this.

## The True Laptop

Dr. Clive Sinclair's latest, Cambridge Computers' 239, is the closest to the physical ideal of the portable computer. The size and shape of an A4 notebook, and weighing in at under 2 lbs, the 239 is convenient, lightweight but extremely usable.

There's a full-size keyboard, and a decimal screen giving 63 lines of around 80 characters, depending on the software. It won't run anyone else's software, but the built-in programs are more than good enough for most applications, consisting of word processor, database, spreadsheet, diary, calendar, and BBC Basic for writing your own. An add-on comes package lets you port data to and from most popular desktop machines, including PCs, Amstrad PCs and Apple Macintoshes.

Prices start at £250, but there are a lot of hidden extras. The mouse adaptor, more memory, EPROM

• The Cambridge 239 — closest to the ideal?

cartridges for storage (and an emulator if you hope to use them) and one comes package can rack the price up close to £500.

## The PC on your Lap

Most surprisingly, the most convenient laptops are PC-compatible. Highly desirable, except that prices tended to be very high. Until A. Sign launched one and the cost came tumbling down.

Around £400 will buy the entry-level Amstrad PPC with 512K of RAM, 720K of floppy disk slot, one, a full-size LCD display, and a full-size (which is so very oversized on a laptop) keyboard. You can even opt for a battery pack, a cigarette lighter socket, or the monitor from an Amstrad 1512 or 1540.

Naturally, you can run any PC software, provided it fits into 512K, and you can opt for the RAM model if memory looks like a problem. Other versions give a touch to notice.

The PPC really only has two problems: the display is, both literally and figuratively, less than brilliant, and the full-size keyboard means you'll need wide open spaces to use it — you could provide a lot if you used it on an average computer room. But the Amstrads represent unbeatable value for money.

There's an enormous range of alternatives, offering better displays and more compact keyboards, and if you shop around you can find any of the following laptop PC clones at under £1,000: Toshiba T1000, Sharp PC500, Zenith Superport, Olivetti M15, Dendwell DS, and Wollers PC Portable.

• The Amstrad PPC — great price, shame about the display

## The Transportables

Typified by the Compaq Portables and the top-end Tobias, these machines are essentially desktop PCs, but with LCD or gas plasma displays built in to the main unit, and in a fold-down case that makes for easy transportation.

You can't use them on the move because they won't work from batteries, but as perfect if you need a PC that can be readily moved from room to

# VP Planner *plus*

version 2

"I can't really see why anyone would buy Lotus 1-2-3 instead of the cheaper, compatible, more powerful and versatile VP-Planner Plus"

*Amateur Professional Computing, September 1988*

## Nor can we. Can you?

Comparison of VP-Planner Plus version 2, 1-2-3<sup>®</sup> rel 2.01 and Quattro<sup>®</sup>

Excess small	0.28	30.00	8.66
Multiply large	0.02	30.00	*
Multiply small	0.20	2.00	2.25

All times in hundredths of a second. Large and small versions of four macro driven worksheets were used. Large models contain more than 75 rows and 75 columns, small models contain 15 rows and 15 columns. Tests were conducted on an AT clone at 10MHz and an emm386. \*Quattro could not load large models with MMS two after DOS. Lotus 1-2-3 returns the values accurate to the screen screen only. VP-Planner Plus runs on IBM PCs and compatibles with 286 or more RAM.

"VP-Planner Plus is a magnificent program and arguably the best spreadsheet on the market today" - PC Plus, February 1988

"More sense than money" - PC User March, 1988

These accolades were based on version one of VP-Planner Plus. Version 2 has now gone even further, and faster!

If you are looking for a spreadsheet that's a cut above the rest, then VP-Planner is the only choice.

Add VP-Graphics to produce the most superb presentation graphics, and with

VP-Expert, you have a complete expert system toolkit to help create and analyse the work. With VP-Info you have the multipower database management program that can handle just about anything any size of business can come up with.

# Just Raring To Go...

**ANDY STORER** looks at six new contenders for the Christmas top position

• You're the little guy... looks like you're up against BIG trouble

## TIGER ROAD US GOLD

Although we've brought you a review of the C64 version on page 33 this week, we liked the graphics so much on the ST version we thought it worth including a screenshot. As you probably missed it in the arcade, let's just say you're up against a bunch of rather Ninjas in level after level of martial arts mayhem.

• The art of subway riding on the Amiga

## GRAFFITI MAN SOFT GOLD

Get a hold of your spray cans, crank up the Rap and get painting in a comic-style quest to become a member of a famous graffiti gang. Problem is, though, there's a whole bunch of people out to prevent you painting up the right locations as fast and at the end of each level you have to copy the artwork you're presented with. The computer

judges your results and if you're a budding subway surrealist it's onto the next. Why was Art 101 school never like this?

## CIRCUS CIRCUS MARTECH

Martech's Big Top combines six circus events to present you with the chance of becoming Master of the ring and its acts. So, roll up, roll up, for taming wild lions, throwing knives, high-jumping, light-bulb walking, the high

• Fly through the air with greatest of ease on your Spectrum

trapeze and last, but by no means least, whizzing through the air as a human catapult. Art Tyndall's Circus Games and Car's Circus Attractions are also due out shortly, you won't have any chance to clown around any longer.

## WANDERER ELITE

This French import for the ST first saw the light on the QL nearly two years ago, where it proved, too late of course, that the Quantum Leap did have games potential. Wanderer is worthy of note for its overlapping blue and red window graphics, which combine to produce optical 3D when viewed with the accompanying spectacles. The gameplay involves zooming all over the galaxy firing at and fleeing from a range of spacecraft out to prevent you delivering playing cards - yes playing cards - to planets in the middle of a poker game.

• No you're not drunk - you just need glasses

# Road wars go 16-bit

**U.S. Gold puts it fast down to seven when Thunderblade Thins think it's too slow**

• Extra weapon drive - thank heavens...

## ROADBLASTERS US GOLD

The midsummer roadies between Elite and U.S. Gold over the similarities between Thunderblade and Roadblasters accelerated right into the court rooms and as far we know they're still there. Two great games for the lawyers among you to check out. But here's the ST ver-

• Motorway madness takes on a whole new meaning

sion of the Atari arcade game that caused the rumpus and it looks to have been worth the wait. Fine and Far get from Titus also burn up the same bit of road, so there's a number of choices open to pedal to the metal merchants. You don't need to overtake as take out your opponents...

## CRAZY CARS 2 TITUS

We all had a tough last week when a rival mag published screenshots from GC2 with captions billing them as Outrun Europa exclusives - that's the same mag that boasts sales of 60000 when it's less than half that - so there's no wonder. Crazy Cars 2 looks like a great follow-up to its predecessor, which bombed as far as most reviews were concerned. You're hitting the brrrrrr with the same kind of racing game but the animated graphics are in a different league altogether. This time you also get to crash quite frequently and instead of merely bouncing around and carrying on.

• No it's not Outrun Europa on the ST!

## This week's sneak-a-peek...

So, we're from the developing tables in the first screen shot of Thunderblade on the Amiga - we've even a new computer version and it looks great, showing even the ST's great graphics fairly down to Earth. It's further proof that the gap between Amiga and arcade is closing all the time and we'll be there with the full review just as soon as we're allowed to print it. Catch our review of **Thunderblade** elsewhere to check out its closest rival.

**W**elcome to the New Computer Express games section, the liveliest, most up-to-the-minute reviews for miles. You'll notice that our reviews are laid out differently from run-of-the-mill computer mags. We:

- use a simple, no-holds-barred, no-kiss-star rating system, where only the very best games get the coveted five-star rating.
- break up reviews into easily-digested sections relating to scenarios, gameplay, graphics etc. — no more hunting to find out what you want to know.
- take version differences seriously. You'll always know what machine the game's being reviewed on, but we'll give you information about other versions too.
- give games of particular significance their own box, together with a flash to say what's different about them.

Firebird's latest on the ST is another release in the long-line of vertically scrolling shoot-'em-ups — so why bother buying this particular incarnation?

#### ● GAMEPLAY

You'd think flying a biplane would be boring by today's standards, but believe us, it only is now!

As you and your biplane glide through some very attractive — but extremely hostile — territory, you'll meet all manner of enemy forces just waiting to give you a hard time.

Tanks, biplanes and anti-aircraft guns are just the beginning of your troubles, because at later levels you'll encounter massive aircraft carriers and secret supply depots — all of which have to be destroyed with lightning response, otherwise you'll kiss another life goodbye.

Fortunately, if things start to get too tough, help can be found in the form of smart bombs, extra firepower and extra lives — all there for the taking.

#### ● GRAPHICS AND SOUND

The backgrounds are stunning, with some very colourful and well-defined objects — and are complemented by equally distinguished sprits.

Audio comprises of soundtrack and spot-effects which are not exceptional but do produce a pleasing background to the on-screen action.

#### ● OTHER VERSIONS

The 3-bit versions were released late last year, and are

• Watch those Fokkers — it's there or it's not

now available on a Compilation tape from Ocean called Turbo Con-Op Hits — along with Arkavard I and II, Revenge, Bubble Bobble, Rastan, Star Fight and Legend Of Kage — all for around £13.

#### ● EXPRESS VERDICT

Flying Shark produces a prize-worthy potpourri of predatory proceedings. You're fired — Ed! Visuals are impressive, audio is great and gameplay is fun — but you're left with a feeling of desecration as you shoot your way through yet another vertically shoot-'em-up on the ST.

Rik Haynes

• Showing your way through sprites shifting in daylight speeds

This 3D arcade-action blaster from French company Titus is one of only a handful of shoot-'em-ups to appear first on the Amiga, in combining fast action with strategy, Conqueror also attempts all deliver taking gameplay. Does it succeed or is it just another spacey shoot out?

#### ● GAMEPLAY

Your job is to protect the planet Gallien with your star-fighter, Thunder Cloud II, as a large rebel force progressively invades the galaxy. From a star-map you select your destination and — hey presto — there you are in the thick of things up against mines, probe-robots, missiles, meteors and, of course, enemy ships of all shapes and sizes. On each planet you'll encounter three types of combat — ground, aerial and space fights, all requiring heavy use of the fire button.

Had a planet of rebels and it's back to the map to decide where to go next to prevent their strategic spread — here the game adopts a tactical war game scenario that the rest is pure, unadulterated blather. Thankfully, you enjoy unlimited lives, once the game only ends when Gallien is invaded — so it's great to have nothing in worry about but the body count.

#### ● GRAPHICS AND SOUND

Galactic Conqueror is visually very impressive, with 3D spacecrafts moving both smoothly and swiftly towards you with ease. This scaling is the major highlight of the game, and proves the programmers know how to shift a sprite or two. Audio is less convincing — the digitised speech accompanying exploding spacecraft would be better if it were louder and more varied.

#### ● OTHER VERSIONS

Available now for Amiga, ST and PC, Galactic Conqueror's also due out on DPC, Spectrum, C64 and MSX. We haven't had chance to see the ST or PC versions yet so it's a bit iffy as to whether they'll duplicate the Amiga's snazzy scaling.

#### ● EXPRESS VERDICT

A good rating on an far as intergalactic shoot-'em-ups are concerned. We particularly like the lack of interruption in gameplay — you can look up and shoot up forever. Whether you'll find time to work your way through all 416 planets in one sitting is another question entirely.

Andy Storer

US Gold Tiger Road conversion marks yet another back-and-forth set-up from Capcom, the arcade masters of the genre.

#### ● GAMEPLAY

You take the role of Lee Wong, a teacher's pet of the highest order, whose task for the day is to rid the land of the evil Iyo Ken Oh, who has been raiding your village and generally been making a nuisance of himself.

Luckily, you'll have the help of a magical jacket which enables you to fly and use any magical weapons that come your way.

On your travels through this multi-levelled, horizontally and sometimes vertically scrolling adventure, you'll encounter all of Oh's little minions, like air-wielding Samurai Warriors, flying Ninjas and acrobatic Snake Wrestlers — before your final confrontation with the Oh or herself...

#### ● GRAPHICS AND SOUND

Tiger Road manages to perform quite well visually, with a varied selection of adequately designed sprites and backdrops — although most of the sprites are too small.

Audio is far less satisfactory, with barely functional soundtrack and sound effects.

#### ● OTHER VERSIONS

The only other version available for review was the Spectrum's — which unfortunately did not exist. The ST and Amiga versions are taking very good check out page 27 for a preview.

#### ● EXPRESS VERDICT

Tiger Road is, on the whole, a competent game — we are unable to judge the closeness to its parent, because it's one of those Capcom titles that must of appeared in only 5% of the arcades around the country!

The problems lie in the fact that it provides nothing new or radically exciting. The gameplay is very limited, but there's a strange consolation to see the next screen — and fortunately there's plenty of them.

Rik Haynes

• An air-wielding beautiful maniac

You drop behind enemy lines as an elite commando type in this combat game from Microprose, with a whole host of different objectives to tackle.

#### ● VERSION UPDATE

There are plenty of scrolling shoot-'em-ups about these days, but Airborne Ranger offers something a little different, in that you can move about in any direction. Ed

# GALDRAGON'S DOMAIN

PANDORA

Amiga - £15.95ek

Due out soon on ST

Scheduled for Spec, CPC, G64

**Galdragon's** is an interactive role-play aim in the vein of *Dungeon Master* - it features similar aims, methods, locations and objects - but differs in so far as in this one you're strictly on your own - there's no bunch of varying gifted and skilful colleagues to help you out of a tight corner.

So, as there are plenty of light corners, you might expect it to be a lot more difficult. And as it took four people nine months to produce you might be right.

## ● GAMEPLAY

You've been chased to battle against the wizard Aaxael - a resurrected scallard of the evil variety who's searching the Lands Of Meevor for the five gems of Zator. Your aim is to locate the gems first and thereby equip yourself with extra powers.

Simple enough, except they're somewhere among 2000 locations, and when you consider a castle or a dungeon is just one of these and it alone may feature up to 250 locations then you're really got your work cut out.

When all five are brought together - well you're well on the way to becoming one helluva guy. As you're already deemed to be uncoordinated in combat skills by your contemporaries, you might think taking the gems from the five powerful creatures who guard them will be a piece of cake. Think again. You're going to need all your wits and cunning to defeat them.

It's best to visit inns and settlements and get some inside knowledge of who you're actually up against. There are several hard-core characters with which to interact and only a few of them are friendly. All are semi-intelligent beings quite capable of turning the tables on you thank you, so watch out.

Besides coupling yourself with others there's also a lot of handy weapons and magical objects to find - two-handed swords, daggers, wands and cloaks among them. It's best to find yourself

some clothing first though - and the kind of gear you'll look best in is the functional sort - armour, shields and chivalry.

Commands are effected by mouse control - various sub-screens depict choices and options available to you. Actions such as closing, opening, locking and unlocking the many entrances and exits you come across are all activated by icons. There's a full range of the usual commands you find in text-based adventures including an inven-

tory screen to show what weapons and objects you're carrying. Speech with other characters, the casting of spells and choice and use of weapon is also conducted in the same way. Movement is achieved by either mouse or joystick.

## ● GRAPHICS AND SOUND

**Galdragon's** main-screen graphics consist of fast-updating, well-detailed locations with large, colorful character sprites. A great deal of attention has been paid to evoking atmosphere in every situation - from castles and labyrinth to forests, plains, caves, temples and

and.

Each major location has a completely original design itself - there's none of the greywall monotony of *Dungeon Master* - and what's more there are 32 colours on screen at any one time, so you're looking at a board-fence of textures. You're left wondering how so much detail and scale can have been incorporated into one package.

Sound is comprehensive too. There's 50K of studio-mastered, digitised FX covering location ambience, combat action and movement along with a further 50K of music. Digitised speech was also to be included but has now been left over to be included in - yep - *Galdragon's* Domain 2!

## ● OTHER VERSIONS

**Galdragon's** due out next on the ST, where graphics should be of the same high quality but sound effects a little less clear due to the Amiga's better sound chip. It's also due out on Spectrum, Amstrad and C64.

## ● EXPRESS VERDICT

Every now and again you come across a game you just know is going to be a banger, and all this time you have *Dungeon Master's* sales record to go on. **Galdragon's** is, actually the same territory, but comprises better graphics, sound and a gameplay that is every bit as compulsive and more.

With this range of locations and atmospheres at hand you could be in *Galdragon's* Domain for a long, long time and so you're talking value for money to the nth degree.

★★★★★

Andy Storer

There are 250 rooms in this castle location - just one of many

This rich detail is typical of the care and attention paid to the graphics

A couple of knights look as though they could make your next step your last

This dungeon's certainly in distress - she must be freezing

IF YOU WIN, YOU LIVE  
IF YOU LOSE.....?

LEISURE GENIUS presents

the computer edition of

# RISK™

THE WORLD CONQUEST GAME

RISK™ is a classic game of strategy. This superb computer version allows you to play with up to 6 friends, or you against the computer. Computer RISK provides intelligent opponents to challenge your skills in strategic planning. There are imaginative graphics, interpretations of new game elements including large, scrolling maps, strategic game-based facilities and more nations to conquer.

RISK™ pulls no punches. It's prepared for ruthless battles with General versus General and cunning traps.

IBM PC & Compatibles	24.95

• You're the blue one and you're fighting the reds (Hang on, is this getting political?)

choosing your own route across the territory as you move towards your objective – be it freeing hostages or annihilating enemy forces.

In addition, there is a short section before each mission where you can choose your supply drop points as you control an aircraft flying over the combat zone. Then you guide your parachute as you glide to the earth, hopefully steering clear of enemy hotspots. Once on the ground you can use a variety of weapons, run, crouch, and even crawl as you take on the enemy.

Arnhem Ranger first appeared on the C64 a year ago, and has taken until now to make it onto any other machines. The graphics on CGA machines are quite good considering the limitations of just four colours – animation and detail being good.

Sound, though – well, let's just say they've made an effort. The effects, including the sound of the aircraft's engines and later, gunfire, are quite good considering – but to incorporate 'tunes' as well was optimistic to say the least, bearing in mind the PC's sound limitations.

The PC version of the game is the weakest, while the ST version should be worth looking forward to.

\*\*\*

Rod Lawton

Last week we were first off the runway with our review of the Spectrum version of this brave aircraft conversion and now we've taken hold of its almost complete ST counterpart.

With coding by The Argonauts of Stagfield 2 time you'd expect Afterburner to clear the skies of most competition, wouldn't you? Of course you would.

• GRAPHICS

Your F-14 Thunder Cat fighter zooms up on auto from its carrier base to commence a seemingly endless aerial attack as you try to total everything that even attempts to enter your field of vision. While your 20 mm cannon continually fires unlimited salvoes, you're hitting fire for missiles to take out any enemy craft that aren't immediately in front of you. A window beneath the main display registers your lock-on, and the target is tracked as the

• Shake, Rattle and Roll – or battle through the shaky scroll

# RAMBO III

OCEAN

C64 • £9.95c; £14.95dc  
Also on Spec, CPC  
Out seen on ST, Amiga

Ocean now gives you the chance to take the persona of that infamous come-bashing Bear-derthal, Rambo – hoping that computer Rambo II will be more successful than its film parent was earlier this year.

Your mission consists of rescuing your long-time friend and colleague, Colonel Trautman, from the evil clutches of the Soviet Union. On your assignment you'll battle through three separate multi-load sections in a bid to ungloriously wipe out the Russian contingent in Afghanistan.

• GAMEPLAY

Section one places you in a Russian fort, searching for the old Traut, who is held captive somewhere within its walls. On your travels you'll encounter loads of Russians – presenting you with a serious choice (Rambo can't handle anything else) – either wipe 'em out or ignore these hateful creations of suburban substance. It's lucky you've got such a large variety of weaponry to choose from: knife, grooves, explosive arrows, pistol and machine gun – after all you might get bored otherwise. You'll also discover various objects lying around which can be picked up and used to help for hinder your further progress.

Once you've found Traut, you must escape from the fort by opening strategically placed bombs, before making your getaway in a thoughtfully provided Russian helicopter.

In the last section, you'll have the chance to now down your Russian opponent by using one of their

AAARGH!

• Level 1, and Rambo's just dropped into a whole heap of trouble

own tanks in case of any too complicated for Rambo's feeble mental capacities – as you make your way to the safety of the Afghan border. Unfortunately, the Russians are pretty mad with you by the time, and throw everything they have at you in a last-ditch attempt to take out Reagan's prep boy. Don't forget it's not that simple driving a tank these days, so you'll have to keep an eye on the damage and gun heat indicators if you want the chance to star in Rambo IV.

The first two sections place you in a familiar Rambo-style environment, a fact it's not a million miles away from Pandora's Into the Eagles Nest – using a top-down, slightly overhead view of the proceedings.

The last section is much more interesting with the action taking place in a head-on Operational Warfighting way.

• GRAPHICS AND SOUND

Average is the word that best encapsulates the audiovisuals of the game. While they are not bad, they only perform their assigned tasks in a rudimentary and factually way.

The only innovative visual touch is the way your energy depletion rate is represented onscreen by a can-can at Rambo's upstaging turning into a ghostly skull.

• OTHER VERSIONS

The Spectrum and Amiga/CPC versions should be out by the time you read this, with ST and Amiga users to follow soon afterwards. Don't expect any big improvements in the graphics though.

• EXPRESS

VERDICT

Even if you can ignore the pale, American – punting mentality, average audio-visuals, and boring but relatively long-lasting gameplay – you'll still find the incredibly awful fun to be reasonable in comparison. Ocean has done the best you could expect with a bad license, but Rambo II just does not deliver on the goods.

\*\*\*

Rik Haynes

• OTHER VERSIONS

The Spectrum and C64 versions are worth checking out, since they make full use of their machines' graphics capabilities. We can only wait to see what the Amiga version will look like – in the meantime there's CPC, PC and V50 versions due.

• EXPRESS

VERDICT

We're disappointed by the technical quality of this conversion. When you compare it to a good conversion from coming to ST – say Eidos' Source Hammer – a look as though Afterburner is only half complete. There's too much of the original's detail missing you might imagine this has been a rubbish to hit the streets for times. A great pity.

\*\*\*

Andy Storer

# ECHELON

Tested as a "true simulator" (if a craft which doesn't exist?) Echelon promises a tough and long game task, with a mixture of action, strategy and exploration.

While flying a C-104, Light Cruiser (code-named 'Tombahawk') in the 21st century, it's your job to contain the pirates that are threatening shipping in the space lanes around his (the newly discovered tenth planet).

### ● GAMEPLAY

More than a hint of Starfighter 2 here, as you have to combine exploration and puzzle solving with a fair dose of good old arcade action. You pilot a 1000 840 kilometres square that contains a variety of interesting objects and locations. Your ultimate aim is all this is to learn the location of the pirate base once and for all, and there are clues down on the planet surface to help you. A map is provided with the game, but only nine of the 35 areas have any detail. It's up to you to explore and map the remainder.

While you're doing that, there's plenty else to be getting on with too. Fly your C-104 as a complex enough task, with a daunting keyboard reference card to keep by your machines. You can practice your flying with three different training courses located on the planet surface (check the map) and also practice displaying and flying your RPN (read).

If you want to concentrate simply on the exploration aspect, you can switch off the bad guys altogether. Alternatively, you can choose to spice up the simulation with sporadic or continuous combat with the pirates. Chances are, once you've got to grips with control of your Tombahawk, you'll fancy firing it a bit.

### ● GRAPHICS AND SOUND

As Echelon leads it's cockpit surround first impressions are good. You have clearly depicted displays and gauges indicating data on velocity, position, altitude, shield level, fuel, RPN, pitch, bank and heading. At last, long years of screen you have a reference of your current sector and its contents. The main screen only loads in a second later presenting you with a wide-angle view of your immediate surroundings. So far so good. You hit the accelerator and, hey presto, better get yourself a pillow. You could doze off while waiting for the screen updates on this one. What's more the main screen loads distinctly CGA colour-wise while your brain attempts to piece together the dots that are meant to signify objects and detail. Okay, so Echelon's been out in the States for well over a year now but even then it looks at least three years old.

### ● OTHER VERSIONS

Out on the E4 for several months – when, if you were lucky enough to live in the States, it came complete with a Loslock (a voice-activated flightstick) – Echelon suffered from slow screen updates.

● EGA – That's your view as you prepare for landing.

### ● EXPRESS VERDICT

Echelon scores on game content and scale, but pales slightly when it comes to graphics (and sound, on the PC). Just as well, then, there's more to it than sheer arcade realism.

★★★★

Andy Storer

## DETAILED GAMEPLAY

● EGA – What have we got here? Evidence of the pirate mayor?

## 4 SOCCER SIMULATORS

With the football season in full swing (Sports, what are you playing at? It certainly isn't football!), software companies were bound to release plenty of football games.

CodeMasters has kicked off with 4 Soccer Simulators, the first game to be released on its new full-price label – but is it worth the extra asking price?

### ● GAMEPLAY

4 Soccer comprises 4 separate games. 11-side soccer, indoor soccer, street soccer and soccer skills – all tied together by this basic theme of football.

11-side soccer is the full featured game, indoor soccer is played in an enclosed area and street soccer is played in a street with cars, fences and out-of-bounds gardens. Soccer skills is a training section including ball control, goalkeeping, penalty taking, sprint training, press-ups, weight lifts, slaps and box lifts.

The soccer games are all basically the same, the only difference being in minor details of play, such as slowing/freezing throw-ins, goalkicks or corners – which may sound substantial, but you don't notice because you're so frustrated by the awkward and slow player controls.

Each game is played on a severely reduced play area in the centre of the screen – using a slightly overhead view of the action. In play they offer nothing new to the already available soccer games.

Soccer skills consists of several psych-wiggling

events – which are so boring you should be awarded extra points for just staying awake – and is obviously tacked on to build up the number of games supplied.

### ● GRAPHICS AND SOUND

The CPC can produce some brilliant colour displays – its a pity CodeMasters didn't use any of them when they made this game – the colour schemes used are dull and boring. Definition and animation of the players is the only adequate visual aspect.

Sound-effects are almost non-existent and those that appear aren't worth the effort – and are accompanied by a chronic and out of place soundtrack on the title page.

### ● OTHER VERSIONS

4 Soccer is just as dire on the Spectrum – only with even fewer colours.

### ● EXPRESS VERDICT

CodeMasters used to produce some very auto-visually appealing, slightly unplayable, but very attractive games. Unfortunately 4 Soccer is another example of the demise of this formula – offering a full-price selection of totally unplayable soccer games complemented by a boring and superfluous training section. Match Day 8 by Ocean is a far superior football game – and it's cheaper too.

The Darling brothers should spend less time promoting themselves, and start to concentrate on producing original and exciting games titles.

○

Rik Haynes

● Even CodeMasters wouldn't sponsor this one!

## Amstrad PC1512/1640/2086

We offer a wide choice of Amstrad PCs with many upgrade options, including the very latest PC2086 range. For the hard disk option, check our 'Evesham Upgraded Models'. Only the best will do - so we normally upgrade by means of a Western Digital Flash, with induction XTRON and SpeedHead software. However, as 10MB drive models we can offer internal installations at the same price (saving more expansion room but no opportunity for a 2nd floppy drive). We can provide on-site service contracts at time of purchase - please for details. Prices in lighter type include VAT.

# What's a computer for?

The functions of the micro can be many and varied...

A fair question often posed by people who haven't yet bought a computer is: What am I going to do with it?

The things you can do with a computer fall into two categories: work and play, and many computers are equally good at both. (Although a lot of people like to think you can run business and pleasure, with only a few days computers you can, and very easily too.)

But because some computers are better at some tasks than others, it helps to have an idea of possible uses before you hand over the plastic.

## The play's the thing

Fantastic computers always spend most of their time playing games. Some observers will tell you that this is because computers see nothing but toys, but the truth is that it's because most of us like to play.

And if you believe all computer games are of the Space Invaders type, then you don't know the half of it. True, most games do involve (often on screen) battles, usually involving aliens, and almost always having a kill-or-be-killed scenario. They're designed to appeal to the child in all of us - they're fast, hot, colourful, exciting... and they can be massively addictive.

But there is a second group of games that require a much more thoughtful approach. This group was commonly called 'adventure' - after the title of the first game of the type - and originally made for

those are others: command a submarine in a battleship, pilot the space shuttle, occupy the hot seat in an air-traffic control tower, drive a Formula 1 grand prix car, run a small company or a large country, or manage a football team.

The best simulations are incredibly realistic, and most are informative and educational while being entertaining.

Finally, there are the compromised versions of 'word' games, for want of a better phrase. These everything have from chess to football, from bridge to golf, even mountain climbing.

Of course there's a lot of rubbish among computer games, but as Theodore Bugez once said, 30

out bottles of Typ-E-er or re-typing whole pages.

So the end result is a picture page, without mistakes, neatly formatted, a thing of beauty.

Obviously you have to do a lot of setting to get the most out of word processing. You'd be foolish to spend £300 or more simply to produce one or two nice letters a year. But if you've bought a computer for whatever reason, word processing is another return on your investment.

## Data date

Databases: thanks to a million crop shares and spy thrillers, this is the one that most computer novices

## What not to do

Although you can make a computer do almost anything, there are certain applications that simply aren't worth bothering with.

For example, there is the classic 'balancing the bank account'. Forget it. If you can't keep track of your money with the aid of your cheque book and a pocket calculator, a computer isn't going to help.

There's also the problem of listing the computer into your everyday life. If you fence a car for the computer more or less constantly through the day - if you're using it in a business environment, for example - it's perfectly feasible and sensible to have a computerised address book or a telephone log. If it doesn't make sense to try the net

same thing at home. You'd be far better off with a Rolodex than juggling through the paper onlooker's notebook software/power all night every time you need a phone number.

Remember: computers can do almost anything, but it's up to you to decide whether it's worth doing a

• You can now do even more with a computer, and faster and cheaper than the typewriter.

per cent of everything is tape - books, TV, cinema, pop music, games, etc. But computer games get that share of the good stuff.

## Give me the word

Perhaps the most common use for computers after parking is for writing, partly because it's one of the things most of us do anyway. Students write essays, business people write reports, teachers write course notes, club members write articles for newsletters, and everyone writes letters - letters in the bank manager, to Mum in the newspapers, to your MP.

A computer can offer a great deal to writers. Provided you can find your way around a keyboard, it can be physically easier to get words on paper, and it can be much quicker. The computer can check your spelling, and other mistakes can be corrected quickly and easily with-

out need of when they picture computers working. Just feed the electronic brain with a couple of random bits of information, and back comes a lot of appropriate names and addresses.

Unfortunately for the ordinary user, you don't buy lots of useful information for your computer to give you. What you can buy - and lots of them - are programs to sort the data into meaningful order, and then to give you that information as a form chosen to suit you. But you have the laborious task of typing all that information into the machine in the first place.

So when it's possible to type in the relevant details of all your favourite restaurants, or your record collection, or your library of books, the physical labour involved is still putting, to say the least.

But if you do have a lot of information that needs to be managed properly - reference notes for your degree thesis, for example, or the membership list for the Shopping-on-the-Green Lonely Hearts Club - the computer is a great helper.

## By the numbers

There is one application for computers that would be close to impossible without their spreadsheet. A spreadsheet is an electronic grid of thousands of boxes, and each box can contain a number, a label, or a mathematical formula. Furthermore, each box can be cross-referenced to other boxes.

All the hard work of calculating all these formulae is left to the computer, which performs the maths almost instantaneously.

But the clever part is that when you change one number, all the related effects of that change can be seen instantly. This makes spreadsheets very useful for businesses because it allows you to calculate the effects of small changes in your finances, while happens if you put prices up by 10 per cent? What happens if your rates rise by 12 per

A third category of computer games covers simulations. Here the computer attempts to model a real-world situation, and then asks you to change. Some of the best are flight simulators, which allow you to control anything from a small private plane, to a helicopter, to a passenger-carrying jumbo jet. But

£21

CRS? And so on.

The spreadsheet also allows such complex mathematical usages to be created that the application is often called financial modelling. You can create a numerical model of anything from a corner shop business, to the national economy.

However, spreadsheets work for any mathematical system - not just money. So an engineer could calculate the effects of stress on a material, or a biologist could model the effects of pollution on small populations, or a model aircraft maker could try various wing shapes and see the effect on lift, drag and other areas of flight performance.

Provided you're comfortable with mathematics, a spreadsheet can be put to use almost anywhere.

## Sound and vision

Computers aren't just good for 'numbers but not' stuff like facts and figures, they can be put to work in the arts too.

If you or your artistic talents seem to have foundered at the level of nursery school finger-painting, your computer can help you get a little further along the road.

Graphics programs allow you to treat your machine as a painter's canvas or sketchpad, or an architect's drawing board. With just basic tools, you can always draw a straight line, or a perfect circle. And with more advanced programs you can create impressive three-dimensional drawings. When you make mistakes, you don't have to start over and waste hours of work. Just erase the offending lines and try again.

In music, your computer will help you make the most of your talents - or even take the fact that you have the musical talents of a stone-deaf donkey. Your computer can teach you to read music, or to make music without understanding as much of theory.

And if you are a genuine musician, you can use your computer to compose songs, and to drive banks of synthesiser drum machines, sequencers, and a veritable orchestra of other instruments.

## Program power

Here's one that a lot of people don't think about these days: programming. In older times (roughly, the day before yesterday) all computer owners learned to program because there was very little else to do. Commercial software was rare. Today, the opposite is true and there's no real need to program.

But there are good reasons why you might like to try. For one thing, just as ordinary people can write

a best-selling novel, ordinary computer users can write best-selling software. The odds of success are about the same in both cases, but it can be done.

But even if you never make a mint out of machine code, programming can be fun anyway. Languages like Basic and Logo are easy to learn, and powerful enough to write interesting programs. And even the most trivial program can be fascinating when you've designed and coded it yourself.

## Whatever you want

Way back in 1983, Don Lancaster wrote: "The reason is a reason that reflects the personality of its use. One user sees the reason as an artistic tool. Another sees it as a business accounting machine. Another plays music on it, while yet another uses it to control the ventilators on his leg fans."

Not much has changed since then, except for the better. These days you can do even more with a computer, and it's faster and cheaper into the bargain. ■

## Need to know?

Any particular concepts or bits of jargon you don't understand? Anything you always wanted to know but were too embarrassed to ask? Why not write to: First Things, New Computer Express, 4 Queens Street, Bath, BA1 1EL. We can't get into private correspondence unfortunately, but the best questions will get answered as these pages. No question too dumb, no subject too simple, and no confounding topics. Guaranteed!

include as a painter's canvas or sketchpad, or an architect's drawing board. With just basic tools, you can always draw a straight line, or a perfect circle. And with more advanced programs you can create impressive three-dimensional drawings. When you make mistakes, you don't have to start over and waste hours of work. Just erase the offending lines and try again.

## Technobabble

A weekly assault on computer jargon

### RS232 • Standards

Ever since Spitting Image immortalised it in RS232C Interface Lead: 20 Classic Songs, the RS232C has been a source of amusement. All those who know, and get a source of bafflement to those who don't, only use a few of them, while others use fewer and/or different ones. Some use male connectors, some use female, and some use subtle variations on the 'standard', like RS423 and RS443.

The only source of action with a reasonable chance of success is to crawl into your dealer's, hunting room details at his feet, and beg for a cable that will work with your computer and whatever you want to connect it to.

Generally, you will need to know to jargon with the fact that the computer industry uses the word 'standard' to mean 'unique'. The two exceptions to this are 'industry-standard compatible', meaning 'it'll run IBM software', and 'de facto standard', meaning 'We've used more of our kit than anyone else so you'd damn well better do it our way'.

# YuppieWare

**Filefax carrier Peter Worlock looks at software aiming to organise you**

Computers have always promised – and often failed – to help you get organised. They've been great at organising third-party mailing lists but not so hot on your personal contacts; they've been brilliant at writing business letters, reports and novels, but less impressive for jotting quick notes; and they've done a fine job of managing projects involving hundreds of staff, but getting them to remind you of a meeting next Tuesday morning can be tricky.

All of which, no doubt, explains why the ubiquitous personal organiser, the leather-bound Pilefax, has enjoyed such a tremendous success.

But what if you could combine the two: the data-processing capabilities of your computer with the ease and convenience of the Pilefax? Two packages for the PC aim to do just that.

## Daatafax

PC • £59.95 (£79.95 inc GEM 3)  
Kempston • 21 Linford Forum, Linford Wood, Milton Keynes MK14 6LY  
(0908 677886)

You have to worry about a company that would deliberately saddle its product with such a bizarre mis-spelled title. But once you get Daatafax loaded, it at least looks better than you'd expect.

The appearance is largely due to the use of GEM, Digital Research's Macintosh-like environment. If you have an Amstrad 1512 or 1640 you already have GEM and can buy the cheaper version of Daatafax, otherwise you'll have to stump up the extra cash because Daatafax will not run without GEM.

### Features

You get the three essential Pilefax categories: diary, address book, and a notepad. Because of GEM, Daatafax is simple to use, being icon and menu driven. So to load a diary you just click on a picture of a diary!

The diary allows you to print one, four or seven days per page, and you simply type in times and accompanying notes as you want. The text editor is fairly crude, but does allow cut & paste so you can move entries around, and there is a search facility to let you find specific appointments more quickly.

As an adjunct to the diary, Daatafax will generate a calendar for you, but this is rather limited: a fixed format with three months on a page, and although it will highlight dates that are marked in the diary, you can't use different forms of highlighting for different categories of event.

The address book initially has one page for each letter of the alphabet and you treat

it just like the real thing. Move the cursor to the start of an entry, then enter name, address, business and home telephone numbers, and a short note if you wish. There is a search facility but, amazingly, there is no sorting – it's up to you to make sure you enter names in alphabetical order.

The notepad is a limited but usable text editor. You can use cut & paste and search for specific words, and you can choose whether to have 24, 34 or 48 characters per line. But you don't use the normal GEM text attributes such as different fonts and styles like bold and italic, nor can you mix different type sizes within the same notepad.

One unexpected and potentially useful feature is the ability to import GEM .IMG graphic files into your notes, although you can't create or alter pictures from within Daatafax itself.

### User interface

Because of GEM, Daatafax is very easy to use (but then the features are so basic it could hardly be otherwise). Unfortunately, it doesn't provide all the power of GEM which is a pity – even simple

enhancements to the sort would be a bonus.

### Documentation

You get a very rudimentary manual (33 pages of large type and lots of pictures) which spends a disproportionate amount of time talking about GEM rather than Daatafax. However, again because of the program's limited features, there isn't a lot to say.

### Verdict

Daatafax is more or less exactly an electronic Pilefax. You might as well stick to the genuine article because using Daatafax on your PC gives you very little that the pen & paper version doesn't. Yes, you can get most printouts to stick in your leather organiser, and you can com-

pare very crude computer-type things like automatic searching for a name.

Against that, there's the expense of the software, and the bother of loading it every time you want to make a note, or add a name to your address book. None of the modules is powerful enough to make it worthwhile keeping Daatafax permanently loaded, and printing out sheets for insertion in your Pilefax promises to be a ridiculously time-consuming exercise.

Oh ... it's also copy-protected – a definite black mark.

## HIGHLIGHTS

- Easy to use
- Can include graphics

## DRAWBACKS

- Means little use of the PC
- Short on features
- Copy protected
- Poor value for money

## How are they meant to be used?

The appeal of linking your computer to your Pilefax is clear, but how in practice is that actually supposed to work?

The intention behind Daatafax and the original Portex appears to be to use them as a way of periodically updating your Pilefax. You type in, say, all your names and addresses on computer and end up with a neat printout which goes into the Pilefax. You can make written additions to this from time to time and then at

some later stage add these to the computer file and get a fresh reprint. Both packages provide the relevant stationary together with details for buying reprints.

The main problem here appears to be the duplication of effort. You write down the information in your Pilefax, when something crops up and then have to rekey it in at some later stage. This may be worthwhile if the software can help you process the information – or if you've got atroc-

ious handwriting and are constantly re-rendering your Pilefax unusable!

It's hard to see either package being used as a total substitute for a Pilefax too portability, even if you were happy to limit it to office use – it wouldn't be worthwhile to load up one of these programs every time you wish, say, to add another diary appointment.

Portex Professional (see box next page) overcomes the latter problem by being memory-resident.

## Portex

PC • £49 from December 1 • (Portex Professional £149)

Showersings Business Systems • South Bank Technopark, 90 London Road, London SE1 6LN (01 922 8821)

Portex was the original Pilefax successor, earning critical acclaim and more than a few friends in the last couple of years. But it's about to get a new lease of life with the launch of the upgraded Portex Professional – see box.

However, instead of ditching the old (and still extremely usable) version, Showings has decided to keep it available at a vastly reduced price.

### Features

Portex offers the same modules as *Dastafar* - diary, address book and notepad - but these remain basic. Because Portex puts the power of the PC to work for you.

The diary, for example, allows you not only to enter dates, times and appointments, but also to enter entries. So if you specify a birthday on repeating yearly, Portex will automatically insert the entry into the calendar date every year. Or you might enter your six monthly dental check-up and Portex will insert that automatically.

Moreover, you can set nagging alarms. If you have to do a monthly report, after saving that as a repeating event, Portex will enter it into your diary at the appropriate time each month, but on the relevant day, and every day thereafter. Portex will flash a message at you until you acknowledge that you've done something about it.

Your diary can be printed out as one, two or four days per page, or one or two weeks per page.

The address book (comparing by called a directory in Portex) offers some surprisingly advanced features. Entries can include salutation, forename, title, multiple telephone numbers, two addresses, organisation name and up to 14 lines of notes. And your file can be sorted by any of the given categories.

gories, so you could have two versions, perhaps: one sorted by individual names, another by company names.

Finally, there's the notepad, although in Portex case it is close to being a fully-fledged word processor. On screen it looks rather like *WordStar*, but it uses its own set of control keys. Most of the commonly-used WP functions are included including search & replace (against *Dastafar*'s search only), cut & paste, and various text formatting commands. You can also use various typetypes like bold and underline, but there are some unexpected but welcome functions like the inclusion of a full 80,000-word spelling checker, and the ability to perform mail-merge with files from your address book.

### User interface

Although Portex is a very powerful program, it remains easy to use thanks to a well-designed menu-driven control system, and the fact that there is an on-line help facility from anywhere within the program.

Most of the control keys are logical, and extensive use is made of the PC's function keypad, but it

## HIGHLIGHTS

- Powerful diary features
- Flexible sorting & address book
- Notepad good enough for most WP needs

## DRAWBACKS

- Needs to be permanently loaded in order to get full benefit

would have been nice to have *WordStar*-compatible commands in the notepad.

### Documentation

The manual is nothing if not comprehensive - 250 pages covering every aspect of the software. It's neatly laid out, and nicely broken up into basic and advanced features so you can work your way into the program gently. It's completed by a glossary, a full index, and a list of Portex commands.

### Verdict

Portex is close to what a computerised *FileMaker* ought to be - a powerful program in its own right that also prints out as *FileMaker*-style paper.

With Portex's features for writing data, and automatically handling your diary, you really must get the benefit of using your PC to manage your personal and business affairs. Any criticism of the program is more a case of extra features it would be nice to have, rather than essential features missing and most of these are included in the upgraded Portex Professional.

★★★★

## Portex expanded

With Portex Professional, the computerised *FileMaker* comes of age. Showings has learned a lot from *Sedock*, *Sortad*'s definitive computerised personal organizer, and has gone on to incorporate its best points with the strengths of the Portex original.

To begin with, Portex now works as a memory-resident program, so you no longer have to tie up your PC

to use it. You can work in your most common applications software and simply call up the various Portex modules at the press of a key. This alone makes it dramatically more useful.

Secondly, if you have a Hayes-compatible modem you can have Portex automatically dial phone numbers from your address books. Other useful features include a stop-

watch for event logging (so you can time phone calls, and professionals charging by the hour or day can calculate the time spent on various tasks); a rudimentary keyboard macro facility; and handy on-line search, sort, and diary summaries.

You have to wonder why Showings doesn't go the whole hog and add in more of the *Sortad*-like features like a memo spreadsheet. But even as it stands Portex Professional can do a lot to get your life in order.

# PC

## All that RAM

Pragmatically, standard 640K is the most standard configuration for users. There was a time, this side of the turn of the decade, when 386 and console data was a good base for a home user, or a small business, on a PC. The 736-640 Model 1 and Commodore PET were good examples of this regime.

Then, a couple of years later, when 640 and then 512K became the norm, the workstation as the office. The usage Superiors, complete with CPM and 80 x 25 text mode screens, became the normal configuration.

## It ain't heavy

If you want the computing world of 87, the looks will be the same in '88. After Oger comes a DTP program, from the house that brought you LIT Word Plus and Timesavers DTP. GDT's Timesavers DTP Lite is designed as an entry into DTP at the very affordable price of £48.95. It's a cut-down version of the full Timesavers DTP DTP Lite, but still features two fonts in both bold and italics and sizes up to 26 point, can import text and graphics from a variety of PC sources and includes graphics drawing, text flow and word wrap and multiple page views.

What you don't get is any laser print support, paragraph tags or documents over 30 pages long. GDM is integrated into the product, so you don't get the GDM Desktop PC, but for £85, you get a half megabyte RAM at least, more for 286. Two of the most things about the package is that its files are upwardly compatible with the full product, and should you decide to upgrade the total cost will be little more than the one-off cost of the full package. Find out more from Direct Distribution on 0954 612958.

At a 10Mf data, dollar is the present, and the standard because of a single floppy and a 20 Mf hard disk, running MS DOS. On each occasion, the best generation of equipment was sold on the added software packages, the extra capacity would make possible. Now, were commonly said, we must give up for MS-DOS, and the choice to make look our own into others.

There are two main, all gives, that comes in all the better from the box on 386. The first is that the main, lesson you give to need 4 Mb or more of memory as a base for the new machines as that 640K device takes 3.5 Mb. It's hard to believe a system can be so much bigger and better than MS-DOS that a patch can't cover the RAM.

The second point is that most of that extra room is taken up providing extra-tasking. There's a lot to be known what that extra-tasking offers, but not to be being better a quick read. Multitasking is the ability of powerful means to run more than one program at the same time. What it is, fact is that the micro-processors when it first between one to more programs by switching between them allow themselves to be a second.

Multitasking is not the same as context-switching, which is what happens when you go up a memory resident program such as SketchUp or TopCopy with a pop-up program, the main application is halted while the other is running. With multi-tasking, both programs

for more of your running them continue to function at the same time.

The question really is why should a single user need to multitask? In business, you're likely to want to be in full control of all the applications running on your PC. There's only one way I can think of why you might want to do two things at once: if you're scrolling text files, you can compare word processing files at the same time, running a complex spreadsheet, or an extensive spreadsheet, I reckon probably only 5% of users would really need to write complex multi-multitasking.

If you're running a network with several users, you will want to be doing different things. You can't absolutely exclude multi-tasking applications. Unless OS/2 is a much more stable operating system than Windows (which already has tasks well-behaved program) in AmigaDOS on the Commodore Amiga, the vast majority of today's PC users will have no possible use for it.

## Furtive moves

If you want to hide the workings of your program from prying users or to hide your games, then look at the rest of the people in the office, or even put secret files on a disk as a form of in-memory copy protection. There's a very simple way to do it. You must be able to produce ASCII character codes then the alphabetized ones from the keyboard, though this

Most down the (A) key, though this (A) on the numeric, key pad, and then release the (A). The last thing you might expect to see is a screen, which says that you've got to be typing, but then exactly what you get by typing down the (A) key, you will see produce any character on the ASCII set by typing an ASCII number on the numeric pad. The following would release depends on file:

ASCII	Hex	Hex	Hex	Hex
0	30	00	00	00
1	31	01	01	01
2	32	02	02	02
3	33	03	03	03
4	34	04	04	04
5	35	05	05	05
6	36	06	06	06
7	37	07	07	07
8	38	08	08	08
9	39	09	09	09
10	3A	0A	0A	0A
11	3B	0B	0B	0B

# SPEX

## The Christmas rush

It's almost time to close up again - that time of year when bewilder it takes time to find the right and trade hard-earned cash for the latest videogames. For once, Christmas is a concept in fact if you believed the hype adverts, which in some cases make certain car manufacturers' efforts look pretty Christmas actually arrived some time in October.

As far as the software houses are concerned, Christmas is most definitely a season to be jolly in. The fact is they sell more product in the Yuletide period than at any other time, which means more filthy lucre as they sleep peacefully.

## Out Run grips

• US: Gold's Out Run - will we do better this Christmas?

Making last year's year was US Gold's Out Run. The type and structure surrounding the game was incredible. A local shop owner told me it was selling more than other titles to it, and that previously every one buying a Spectrum was requesting a copy of Out Run too. The game's popularity is enduring. I was amazed to see it's recently re-released the Spexy tape 15. In these anybody can share who doesn't own the thing? Out Run's popularity is enduring. I was amazed to see it's recently re-released the Spexy tape 15. In these anybody can share who doesn't own the thing? Out Run's popularity is enduring. I was amazed to see it's recently re-released the Spexy tape 15. In these anybody can share who doesn't own the thing?

The game's popularity is enduring. I was amazed to see it's recently re-released the Spexy tape 15. In these anybody can share who doesn't own the thing? Out Run's popularity is enduring. I was amazed to see it's recently re-released the Spexy tape 15. In these anybody can share who doesn't own the thing?

And so that's why you'll find it in the shops before it collapses. If you have got any comments, send them to the 21st floor.

## Gargoyle remembered

The great thing about the magazine

and budget service have managed the industry in the way it allows a new format in the computer business a chance to sample some magazine Spectrum advice.

I think I was a bit young to remember Gargoyle Gargue (last PSL) only released the last time around, as was only aware of their starting work for this in the form of Gargoyle Duo and Thunderbolt. Looking through their back catalogues, now released on the Red II disk. I was surprised to discover that if anything their old stuff is even better, especially in terms of concept and originality.

The last Gargoyle game, Ad Astra, is a strange 3D arcade offering, which is great to play but a bit lacking when compared to their trilogy of brain-stretching puzzlers The Big, Don Dancin' and Manpower.

The first of these ones are school, and both feature a supply-type character called Cuckoo. I'm tentatively assuming as the boys in school a lady of my dreams. Don Dancin' is better than its predecessor, with depth character interaction and even tougher puzzle Manpower is a more of a similar fashion, and has collected the stylish graphics of the other two. This time the dance is set in a futuristic club complete as you read the book. The last, Manpower, is a more of a similar fashion, and has collected the stylish graphics of the other two. This time the dance is set in a futuristic club complete as you read the book. The last, Manpower, is a more of a similar fashion, and has collected the stylish graphics of the other two.

All the above are set on Red II, priced £3.99

## Cheat time

Finally a cheat for Cybernet II, a game equal to superb Houston-based. Before you know as O B G Y and you'll have infinite time. All those you're looking for. Please don't forget to buy the book. Always

## Supreme compilation

Just to show they're in on this Christmas goodwill, most of the major software houses are offering a selection of value-for-money compilations.

There's a multitude around. Probably the best I've seen is Supreme Challenge. It contains only five games, which seems fairly poor when compared to the two and twenty game packages we offer from Ocean and US Gold. It's certainly quality and not quantity with this one, though.

The impressive line-up is Elite, ACE 2, Starfighter, Tetris and Sentinel. Starfighter was the first sector-galaxy shoot-em-up which helped to flag a fair few ST and Amiga in its 16-bit incarnation. I wouldn't let that put you off, though. The Spectrum version is brilliant, real fast and furious stuff.

ACE 2 is probably the weakest game of the compilation. It is a flight sim with unrealistic combat overtones. Tetris is an action-packed puzzle game which you'll start off hating, but after 3 or 4 hours' play will admit you're hooked. The Sentinel was released last year to huge acclaim. It's a fascinating and totally original game based around a hide-and-seek theme. I love it. Elite doesn't need much introduction - suffice to say, if you haven't played it you haven't lived. Originally released on the BBC (remember those?), it's a complex mix of strategy and dogfight. Popularity has meant conversion to practically every computer, and you can rest easy in the knowledge that the Spexy version is one of the best. Elite is my all-time favourite game, and its inclusion transforms the compilation from a good one to probably the best value-for-money you can buy this Christmas. Go on, give your Spexy a treat.

Hands up all those who can't put their finger on it...

Now there's no need to load in all your disks to find that elusive file - just look up the details you want in

## The Disk Organiser

Find out at a glance:

- Which disk your files are on
- What filename contains what data
- How much space is left on a disk

# MASTERTRON<sup>z</sup>C

## Nobody does it better!

Programmers, don't be duped by other companies claims - when it comes down to publishing budget software there's really only one choice.

**Fact:** Mastertronic has the largest market share in the UK software industry.

**Fact:** Mastertronic has over 1500 outlets in the UK alone, including high street stores and supermarket chains, more than any other software house.

**Fact:** Mastertronic has extensive distribution in Europe and its own company in the USA.

**Fact:** Mastertronic is part of the Virgin Group - one of the world's most successful entertainment companies.

**Fact:** Mastertronic is looking for good quality, original C64, Spectrum, Amstrad CPC, Atari ST, Amiga and IBM PC games.

If you think you can meet our standards send a copy of your game with instructions to:

**THE MAGIC  
POST BOX.**

Mastertronic,  
2-4 Vernon Yard,  
Portobello Road,  
London W11 2DX.

# WANTED!

## YOUR PROGRAMS

- Have you written any commercial-quality games or utilities?
- Are you competent at Z80, 6502 or 68000?
- Do you want to make money?

If the answer to the above is yes, then First Byte Software wants to hear from you.

Write now to:

**First Byte Software**

# PSsst!

A last look at the computer scene by cynical old hack, Private I

## The death of Commodore!

Commodore has gone bust. No, really. It's snuffed it, exists no more, etc, etc.

And who is the source of this impeccable information? Perhaps those dreaded rivals Atari ever been to bite the hand that breeds them? Surprisingly not. It's Dixons - or a Dixons' salesperson at any rate.

It seems that an innocent punter - curiously well connected with Commodore, as it turns out - went into a Dixons store with the acceptable intention of buying an Amiga 500.

"Well - we don't sell 'em any more," he was informed. "Not since they've gone bust."

A couple of years back, Commodore might've reacted in horror at this (and not just because the AS500 didn't exist) then. In these days, it was running so bank debt so huge that the banks couldn't afford to finance, on much the same lines as the financial world couldn't close Third World countries. Come 1988, it is confident enough to tell such anecdotes about itself.

But it all goes to underline what Express emphasised last week: that multi-stores such as Dixons really are immensely capable of offering mindless trash when it comes to computers.

**Merve to the multiplex:** By all means provide bubble-headed kids with vaguely

gaufal employment. By all means have some sort of collective responsibility to the less advantaged in society. But don't for a nanosecond imagine that they can be sensible aids in the delicate matter of buying a computer. Stick 'em in it: anything more is simply taking philanthropy too far...

## The winter of disk intent

Not only is the post-atomic bomb nuclear winter survivable, but we'll all be thinking Amstrad for our future well-being.

This appears to be the gist of the view from the Civil Defence Authority, which is entrusted with such things. For not only has it laid down survival plans should the unrepeatable do the inconceivable, but it is also running its whole damn cabbodine from Amstrad PCs. Surely, any surviving computer hack will then be wholly justified in running the old "Amstrads overheard" story yet again.

"The survivors will need all the help we can give them and the control of resources will be all-important. Our subjects will include funerals (I and an emergency postal service," says the man with a keen sense of priorities, the boss of CDA Brian Hope.

So when you're down in your bunker, having protected to survive, you can thank the Lord God Sugar for having created PCs cheap enough for the CDA to be able to afford. Nolo-cudio AI may be able to go from 0 to 10 furious at the drop

of an alch, but he does have a certain far-sightedness.

## There's one porn every minute

Call a game Sex Vixens From Space, bang on about the supposed naughty bits, chuck some time, irrelevant nudity on the cover, and what do you get? Well, initially, you get to write on about what a terrific scam the whole silly enterprise is (Express I) and gain a pseudo-tabletoid reading (Shock Sex Hyde Scam Probe).

So far, so good. But if you're A-Soft, you then get your games impounded by the porn squad at Heathrow airport.

So what do you do then? If you're A-Soft, you backrack really. "Oh, so the game's been hyped up, but there really isn't that much sexual content. It's a heck of a lot tamer than Strip Poker," admitted a chastened boss Tim Harris to trade mag. CTW.

But if you're an A-Soft distributor like Precision Software, you go berserk. "It's a brutal, fascist regime stopping simple software coming in. The closest you get

to seeing anything in the game is in your head," wailed the firm. Meanwhile, the rest of the sensible world cherishes "If you will play with fire..."

## How to sniff out trendy offices

The pompously-named Medagistic, which once went by the perfectly serviceable moniker of Activision, has encountered a little local difficulty with its new premises in oh-so-trendy Reading. Staff, it seems, are complaining about the building's proximity to a sewerage works.

Unsubtle pundits are merrily suggesting that such closeness to effluent explains a great deal about its software, its upcoming pile of hits notwithstanding. More sophisticated folk are making allegations in oh-so-trendy Reading. Staff, it seems, are complaining about the building's proximity to a sewerage works.

Medagistic may not exactly be in the - or, pit, but then its current position is nothing to write home about. Roll on Afterburner. ●

# NEXT WEEK

## ● Britain's six best-value PCs

We name them and compare them in detail in another unmissable, fact-packed buyer's guide. If you're thinking of buying a computer for serious usage, this feature is an essential read.

## ● Games which take over your life

Every so often, you discover a computer game which is so totally absorbing, you can do nothing else but play it for months on end. We reveal the programs which have had this effect on us.

## ● The 12 days of Christmas

An unbelievably exciting competition which could win you goodies beyond your wildest dreams AND a partridge in a pear tree!

## ● PLUS

- The Alan Sugar story continues.
- The latest incarnation of Proteus reviewed.
- The liveliest letters pages in the land.

- More computer job ads.
- The very latest, liveliest news.
- The funniest quotes.
- The hottest reviews and previews.
- A stack of tips.
- Another page of PSsst.
- And much, much more.

Only 48p!

On sale Thursday December 1  
**Don't miss it!**

## Hype springs eternal 3

Quite possibly for the very last time, here is your univalued opportunity to parade your understanding of the real meanings of computer terms. This week: Sales & Marketing blurb. What do the following mean?

1. "...and comes complete with a comprehensive manual"
  2. "By now whilst stocks last"
  3. "Never before have a major software house encountered on such a mission"
  4. "This is gonna be our biggest seller ever"
  5. "Special Christmas bundle"
  6. "The biggest and the best"
  7. "And new, specially adapted for the UK audience, comes Europe's top-selling XXXX"
  8. "The computer that can do everything"
  9. "It's essential"
  10. "The most extraordinary tool of its kind"
- a) You're reading an Activision ad penned by the buffoon who popped up in 1, 3, 5.  
b) I'm going bust b) I've been shafted by a bunch of crooks who loaded me with this load of old toot c) Come back in 6 months and they'll still be here.  
c) I've been shafted by a bunch of crooks who loaded me with this load of old toot c) Come back in 6 months and they'll still be here.

#### AMSTRAD 2086

Amstrad's new range available from stock at Computer Express NOW! This weeks super deal - Amstrad 2086 30Mb Hard Disk 12" Colour Monitor. **£1119**

#### LOTUS 1-2-3

The leading Spreadsheet and without copy protection. Faster to use, with increased calculation capability, and most flexible graphics. New Version 2.01 can read all other Lotus files. **£245**

#### AMSTRAD 1640

1st excellent value for money 486x33MHz (333) 486 RAM. Above: 256K MS-DOS. For extra value fit a 2086 Hard Disk and get a hard disk performance at a lower cost. This weeks special - Double Drive with Mono Monitor. **£584**

#### DBASE IV

At last it's here! The new version of the UK's most popular Database software. Lots of new features to make all its competitors (except the Ashton Tale hopes). Our introductory price. **£370**

#### WORD PERFECT (Version 5)

It's NEW, but it works just like the previous popular Version 4.2. Now with many new DTP file features, and even more profit rates. Word Perfect is again asserting why it is the most popular WFP package on the market. **£219**

#### TIMWORKS

The latest in low-cost DTP. An excellent package for anyone wanting to make a start in DTP for a very small start. Timeworks is very popular, and has good telephone support from the manufacturer. **£89**

#### HP DESKJET

Latest quality at a low price. Print resolution of 360dpi for both budget text and full page graphics. Can be used like a normal printer with just 100psi of 120psi in draft and 120psi in true LQ. Built-in cut sheet feeder and 198 buffer. 4-1/2 x 11. **£659**

#### EPSON LQ2500 PLUS

It's not very expensive when you consider all its features, this impressive fast 324dpi dither, 150psi printer continues to be in heavy demand. Probably the best Epson ever made. 24 pin printing, 132 column with built-in tractor feed. **£711**

#### SPECIAL EPSON PCAX2 EGA OFFER

At last a fast (10MHz) AT compatible machine at a price you can afford. This Special Offer comes bundled with MS-DOS, Keyboard, 4Mb Super VGA Colour Monitor and 20Mb base unit. All you need in a desktop PC. **£1499**

#### EPSON LQ850/LQ1050

These new 24 pin winners from Epson are the latest hot models in the inkjet market. 100psi of 320psi draft and 100psi in 24 pin letter quality mode. They're also everybody's short list. This is one buy you won't regret. Panasonic, they have a built-in tractor feed as well. LQ850. **£429**  
LQ1050. **£379**

#### TANDON PCA 20 PLUS

Latest version of the successful PCA 16MHz 80386 machine. Standard 1Mb of memory, PC-D output and 1.5 Mb floppy disk. New lower prices in all our Tandon PCs. Choice of monitor. EGA. **£1599 mono £1299**
